U.S. GOVERNMENT RESTRICTED RIGHTS. UNPUBLISHED–RIGHTS RESERVED UNDER THE COPYRIGHT LAWS OF THE UNITED STATES. Use, duplication, or disclosure by the U.S. Government is subject to restrictions set forth in FAR Section 52.227-14 Alt. III (g)(3), FAR Section 52.227-19, DFARS 252.227-7014 (b), or DFARS 227.7202, as amended from time to time. Send any contract notices to Contractor/Manufacturer:

BMC Software, Inc.
2101 CityWest Blvd.
Houston TX 77042-2827
USA

Contacting BMC Software

You can access the BMC Software Web site at <http://www.bmc.com>. From this Web site, you can obtain general information about the company, its products, special events, and career opportunities. For a complete list of all BMC Software offices and locations, go to <http://www.bmc.com/corporate/offices.html>.

USA and Canada

Address BMC Software, Inc.
2101 CityWest Blvd.
Houston TX 77042-2827

Telephone 713 918 8800 or
800 841 2031

Fax 713 918 8000

Outside USA and Canada

Telephone (01) 713 918 8800

Fax (01) 713 918 8000

Customer Support

You can obtain technical support by using the Support page on the BMC Software Web site or by contacting Customer Support by telephone or e-mail. To expedite your inquiry, please see “Before Contacting BMC Software,” below.

Support Web Site

You can obtain technical support from BMC Software 24 hours a day, seven days a week by accessing the technical support Web site at <http://www.bmc.com/support.html>. From this site, you can

- read overviews about support services and programs that BMC Software offers
- find the most current information about BMC Software products
- search a database for problems similar to yours and possible solutions
- order or download product documentation
- report a problem or ask a question
- subscribe to receive e-mail notices when new product versions are released
- find worldwide BMC Software support center locations and contact information, including e-mail addresses, fax numbers, and telephone numbers

Support via Telephone or E-mail

In the USA and Canada, if you need technical support and do not have access to the Web, call 800 537 1813. Outside the USA and Canada, please contact your local support center for assistance. To find telephone and e-mail contact information for the BMC Software support center that services your location, refer to the Contact Customer Support section of the Support page on the BMC Software Web site at www.bmc.com/support.html.

Before Contacting BMC Software

Before you contact BMC Software, have the following information available so that a technical support analyst can begin working on your problem immediately:

- product information
 - product name
 - product version (release number)
 - license number and password (trial or permanent)
- operating-system and environment information
 - machine type
 - operating system type, version, and service pack or program temporary fix (PTF)
 - system hardware configuration
 - serial numbers
 - related software (database, application, and communication) including type, version, and service pack or PTF
- sequence of events leading to the problem
- commands and options that you used
- messages received (and the time and date that you received them)
 - product error messages
 - messages from the operating system, such as `file system full`
 - messages from related software

About This Book

This book describes the services offered by the MAINVIEW® SYSPROG Services software. It contains information about accessing and invoking SYSPROG Services, and includes detailed information about each service. It is intended for systems programmers, developers, operations personnel, and applications developers.

Throughout this book, references to OS/390 support also include support for MVS and z/OS.

How This Book Is Organized

This book is organized as follows. In addition, a glossary of terms and an index appear at the end of the book.

Chapter Number and Title	Description
Chapter 1, "Introducing SYSPROG Services"	describes the features and operation modes of SYSPROG Services and the services it offers
Chapter 2, "Controlling the SYSPROG Services Environment"	describes the BBPARM library and how to use it to control various aspects of the SYSPROG Services operating environment
Chapter 3, "Using SYSPROG Services"	describes how to access SYSPROG Services and how to invoke it as a started task (STC) or a TSO command
Chapter 4, "Synchronous Services"	provides detailed information about all synchronous services, which help improve productivity by allowing you to manipulate various OS/390 intervals
Chapter 5, "Exception Monitor Samplers"	provides detailed information about the Exception Monitor samplers, each of which monitors a different aspect of system performance

Related Documentation

BMC Software products are supported by several types of documentation:

- online and printed books
- online Help
- release notes and other notices

Note: The messages that MAINVIEW SYSPROG Services generates are available online by typing **msg** followed by the message number on any MAINVIEW screen.

In addition to this book and the online help, you can find useful information in the publications listed in the following table. As “Online and Printed Books” explains, these publications are available on request from BMC Software.

Recommended Reading	Purpose
<i>MAINVIEW® Quick Reference</i>	introduces the MAINVIEW family of products and lists the commands used to manage the MAINVIEW windows environment
<i>Using MAINVIEW®</i>	explains the MAINVIEW environment
<i>MAINVIEW® SYSPROG Services Quick Reference Guide</i>	contains variable and service descriptions, with examples
<i>MAINVIEW® Common Customization Guide</i>	tells you how to perform the implementation tasks common to all MAINVIEW products
<i>MAINVIEW® SYSPROG Services Customization Guide</i>	describes the post-installation customization steps you need to follow to make SYSPROG Services completely operational at your site
<i>MAINVIEW® Administration Guide</i>	describes MAINVIEW administrative functions
<i>MAINVIEW® Installation Requirements Guide</i>	contains prerequisite information that is required for the installation of MAINVIEW products on OS/390 and z/OS systems

Online and Printed Books

The books that accompany BMC Software products are available in online format and printed format. If you are a Windows or Unix user, you can view online books with Acrobat Reader from Adobe Systems. The reader is provided at no cost, as explained in “To Access Online Books” on page xiii. You can also obtain additional printed books from BMC Software, as explained in “To Request Additional Printed Books” on page xiii.

To Access Online Books

Online books are formatted as Portable Document Format (PDF) files. You can view them, print them, or copy them to your computer by using Acrobat Reader 3.0 or later. You can access online books from the documentation compact disc (CD) that accompanies your product or from the World Wide Web.

In some cases, installation of Acrobat Reader and downloading the online books is an optional part of the product-installation process. For information about downloading the free reader from the Web, go to the Adobe Systems site at <http://www.adobe.com>.

To view any online book that BMC Software offers, visit the support page of the BMC Software Web site at <http://www.bmc.com/support.html>. Select a product to access the related documentation.

To Request Additional Printed Books

BMC Software provides printed books with your product order. To request additional books, go to <http://www.bmc.com/support.html>.

Online Help

The MAINVIEW SYSPROG Services product includes online Help. This Help service is also available when SYSPROG is operating outside of the MAINVIEW environment.

In the MAINVIEW SYSPROG Services ISPF interface, you can access Help by pressing **PF1** from any ISPF panel. See the online description of the HELP command for more information.

Release Notes and Other Notices

Printed release notes accompany each BMC Software product. Release notes provide current information such as

- updates to the installation instructions
- last-minute product information

In addition, BMC Software sometimes provides updated product information between releases (in the form of a flash or a technical bulletin, for example), and maintenance announcements accompany maintenance releases. The latest versions of the release notes and other notices are available on the Web at **www.bmc.com/support.html**.

Conventions

This book uses the following general conventions:

Item	Format	Example
information that you are instructed to type	bolded and in Times 10 pt. font	Type SEARCH DB in the designated field.
specific (standard) keyboard key names	bolded and in Times 10 pt. font	Press Enter .
field names, text on a panel	bolded and in Times 10 pt. font	Type the appropriate entry in the Command field.
directories, file names, Web addresses	bolded and in Times 10 pt. font	The BMC Software home page is at www.bmc.com .
nonspecific key names, option names	every letter capitalized	Use the HELP function key. KEEPDICTIONARY option
MVS calls, commands, control statements, keywords, parameters, reserved words	every letter capitalized	Use the SEARCH command to find a particular object. The product generates the SQL TABLE statement next.
code examples, syntax statements, system messages, screen text	in a Courier font	//STEPLIB DD The table <table_name> is not available.
emphasized words, new terms, variables	in italics	The instructions that you give to the software are called <i>commands</i> . In this message, the variable <i>file_name</i> represents the file that caused the error.
single-step procedures	preceded by the >> symbol	>> To enable incremental backups, type y and press Enter at the next prompt.

This book uses the following types of special text:

Note: Notes contain important information that you should consider.

Warning! Warnings alert you to situations that could cause problems, such as loss of data, if you do not follow instructions carefully.

Tip: Tips contain useful information that might improve product performance or that might make procedures easier to follow.

Syntax Diagrams

Syntax diagrams are used throughout this book to illustrate syntax usage for services. Syntax diagrams graphically depict the relationship between literal and variable (or other notational) items as understood by an application program or programs. Consult the following table for the meaning of conventions used in these diagrams.

Convention	Meaning
»	Double right arrowheads—the beginning of a syntax diagram.
▶	Single right arrowhead—can have two meanings: <ul style="list-style-type: none"> When found at the beginning of a line, it indicates that the syntax diagram is continued from another line or diagram. When found at the end of a line, it indicates that the syntax diagram continues to another line or diagram.
◄◄	Opposing arrowheads—the end of a syntax diagram.
»—keyword—◄◄	An item on the main line of the diagram is required.
»—literal—◄◄	A literal is represented in flat text.
»— <i>variable</i> —◄◄	A variable is represented in italic text.
»— ┌ keyword ─┐ └──────────┘	An item above the main line of the diagram is the default.
»— └ keyword ─┘ ┌──────────┐	An item underneath the main line of the diagram is optional.
»— ┌ keyword ─┐ └──────────┘	Anything under the upward left-branching arrow can be repeated.
»— ┌ keyword ─┐ └ keyword ─┘	A vertical list of options requires you to choose one.
»— ┌ keyword ─┐ └ keyword ─┘	A vertical list of options with the topmost option left blank indicates that you can choose one option or none.

Chapter 1 Introducing SYSPROG Services

This chapter outlines the features, services, and various operation modes of SYSPROG Services. It concludes with a discussion about the relationship between SYSPROG Services and other BMC Software products.

This chapter includes the following topics:

SYSPROG Services Features	1-2
How SYSPROG Services Operates	1-3
Service Types	1-4
How SYSPROG Services Works with Other Products.	1-4

SYSPROG Services is a real-time software tool that helps your data center manage the day-to-day performance and operation of the operating system environment by helping you to detect, diagnose, and correct problems as they occur.

The synchronous services and Exception Monitor samplers of SYSPROG Services provide the tools for online system management. Data center personnel can delegate tasks to SYSPROG Services by storing a series of operational commands that can be executed automatically.

SYSPROG Services Features

SYSPROG Services provides the following features to increase data center productivity, improve system throughput, and manage job deadlines:

- Synchronous services

This feature lets you examine overall system performance, isolate specific system performance delays, and take corrective action. Services are invoked when entered.

- Exception Monitor samplers

This feature provide early detection of potential performance problems through user-defined threshold indicators. Highlighted warning messages notify you of impending system problems.

- SAF security interface

This feature provides an interface to an external security manager (ESM) to prevent unauthorized use of SYSPROG Services.

- Password protection facility

This feature can also be used to prevent unauthorized use of SYSPROG Services.

How SYSPROG Services Operates

SYSPROG Services operates as an authorized program within the MAINVIEW Product Address Space (PAS), as a TSO command within a TSO address space, or as a batch job or started task. You can use SYSPROG Services in the operation modes that best suit your needs. Table 1-1 lists each of the available modes and gives a brief description of each.

Table 1-1 SYSPROG Services Operating Modes

Mode	Description
PAS	You can access SYSPROG Services from a MAINVIEW User Address Space (UAS). You can also use the MVS MODIFY command to enter SYSPROG commands from a system console.
TSO	You can invoke SYSPROG Services as a TSO command, in which case it operates in line mode. Note: SYSPROG must be defined as an authorized command.
Started Task	You can also use the MODIFY command to enter SYSPROG Services commands from a system console. Alternatively, you can reply to an outstanding WTOR prompting you to enter a command.
Batch Job	You can use the MODIFY command to enter SYSPROG Services commands from a system console. Alternatively, you can reply to an outstanding WTOR prompting you to enter a command. You can also execute SYSPROG Services in a <i>non-conversational mode</i> , with the input commands obtained from SYSIN and the output directed to SYSPRINT. To operate in this manner, specify PARM=BATCH on the EXEC statement.

For more information on the operation modes, refer to the *MAINVIEW[®] SYSPROG Services Customization Guide*.

Service Types

SYSPROG Services provides two types of services: synchronous services and Exception Monitor samplers.

Synchronous Services

Synchronous services are executed when you enter the command and the output is returned directly to you. For example, if you are executing SYSPROG Services as a TSO command and you execute the CPU service by entering the command **CPU**, the service collects data for the period specified, and then displays the results on your terminal. See Chapter 4, “Synchronous Services,” for a complete description of the available services.

Exception Monitor Samplers

The SYSPROG Services Exception Monitor samplers execute periodically but only produce output when one or more of the thresholds you have established are exceeded. You can view the messages from a MAINVIEW User Address Space (UAS) using the WARN view when SYSPROG is operating within the Product Address Space (PAS); optionally, you can have these messages displayed on the system console.

When SYSPROG Services is operating as a TSO command, you can have the messages displayed at your TSO session or on the operator console. When SYSPROG Services is executing as a started task, the Exception Monitor messages are displayed on the system console. See Chapter 5, “Exception Monitor Samplers.”

How SYSPROG Services Works with Other Products

SYSPROG Services works in conjunction with other BMC Software products, both as a component and as an instrument for gathering data.

The Exception Monitor has the ability to generate AO Alerts through AO AnyWhere.

Chapter 2 Controlling the SYSPROG Services Environment

This chapter describes the BBPARM library and how you can use it to control various aspects of the SYSPROG Services operating environment. It includes the following topics:

Introduction to BBPARM Library Members	2-2
\$\$INEXCL	2-4
\$\$INNWTO	2-5
\$\$INSYS0.....	2-6
\$\$RPJOBS	2-11
\$\$RPTEXT	2-12
\$\$XENQ.....	2-13
PWSCPMxx	2-14

Introduction to BBPARM Library Members

You can control the operations of SYSPROG Services by modifying a partitioned data set (PDS) containing members that set initial values for the services functions. This PDS must be allocated to a DD name in the address space where SYSPROG Services executes; the DD name is //BBPARM.

When you initialize SYSPROG Services in Started Task mode or Batch mode, the values stored in BBPARM library members are read and placed in storage, where they remain in effect for each service. If SYSPROG Services cannot find the DD name //BBPARM, default values are used instead.

If you are running SYSPROG Services in TSO mode, you can use BBPARM library members by allocating the BBPARM data set to your TSO address space and giving it the DD name //BBPARM.

Note: For compatibility with previous versions of SYSPROG Services, //LIB is also supported for the DD name //BBPARM.

You also can create BBPARM members containing lists of SYSPROG Services, OS/390, or JES commands and use the EXECUTE service to execute these lists. See “EXECUTE” on page 4-79 for more information.

Table 2-1 on page 2-3 lists each BBPARM library member, along with a brief description and page reference where complete information can be found.

Table 2-1 BBPARM Library Members

Member	Description	See Page
\$\$INEXCL	Specifies which job names are excluded from exception reporting by specified Exception Monitor services.	2-4
\$\$INNWT0	Restricts SYSPROG Services command entry to Modify mode.	2-5
\$\$INSYS0	Defines runtime parameters for SYSPROG Services.	2-6
\$\$RPJOBS	Exempts jobs with constantly outstanding WTORs from the SYSPROG Services outstanding reply scan.	2-11
\$\$RPTEXT	Exempts constantly outstanding WTORs from the SYSPROG Services outstanding reply scan.	2-12
\$\$XENQ	Specifies major names to be excluded from the ENQUEUEES service contention display and from the Exception Monitor ENQ sampler warning messages.	2-13
PWSCPMxx	Stores selectable sets of Exception Monitor Samplers.	2-14

The following sections describe the BBPARM library members, including syntax rules and examples.

\$\$INEXCL

This member contains job names that you want to exclude from exception reporting by specified Exception Monitor services.

Syntax Rules

The format is

service-name jobname1,...jobname7

where

service-name

Is the name of the Exception Monitor service that is to exclude selected job names from exception reporting.

The service names that you can specify are CPU, ENQ, JET, JVR, JSU, and OUT.

jobname1-jobname7

Are the names of up to seven jobs that are to be excluded from exception reporting.

Defaults

None.

Example 1

To exclude jobs CPUJOB1, CPUJOB2, and CPUJOB3 from exception reporting by the Exception Monitor CPU service, place the following control statement in member \$\$INEXCL:

CPU CPUJOB1,CPUJOB2,CPUJOB3

Example 2

To eliminate TCAS and DUMPSRV address spaces from exception reporting by the OUT service (which monitors swapped-out address spaces), place the following control statement in member \$\$INEXCL:

OUT TCAS,DUMPSRV

\$\$INNWTO

This member suppresses the WTOR message `AMT000A ENTER SYSPROG Services COMMAND`, issued when SYSPROG Services is running as a batch job or a started task.

When you run SYSPROG Services as a batch job or a started task, you can enter SYSPROG Services commands in two ways:

- by using the OS/390 system command `MODIFY`
- by replying to the WTOR message `AMT000A ENTER SYSPROG Services COMMAND`

If you want to use only the `MODIFY` command to enter SYSPROG Services commands, you can suppress `AMT000A ENTER SYSPROG Services COMMAND` WTOR messages with member `$$INNWTO`. To do this, place member `$$INNWTO` in the `BBPARM` data set; no records need be present.

In addition, you can suppress the `AMT000A ENTER SYSPROG Services COMMAND` WTOR message by specifying an OS/390 subsystem command ID character to identify SYSPROG Services commands. See the description of the `CMDID` keyword in member `$$INSYS0` (page 2-7) for more information.

\$\$INSYS0

This member defines run-time parameters for SYSPROG Services. SYSPROG Services reads this member when it initializes.

Syntax Rules

Table 2-2 lists the keyword parameters in member \$\$INSYS0. The following syntax rules apply:

- Keywords must be entered in the format *keyword=value* (for example, **MSGID=NO**).
- Statements can be continued to the next line if they end with a comma.
- Comment lines start with an asterisk.
- Leading blanks prior to the first keyword are allowed.
- Embedded blanks are not allowed; they terminate the scan of the statements.

Note: Route codes are only used when sending unsolicited messages (that is, when the messages are not in response to a request or command).

Table 2-2 **Keywords for Member \$\$INSYS0 (Part 1 of 5)**

Keyword=Value	Description
AEWALERT=NO YES	Specifies whether Exception Monitor messages should be sent to AO AnyWhere for use as AO Alerts. <ul style="list-style-type: none">• NO—Does not sent the Exception Monitor messages. This value is the default.• YES—Sends the Exception Monitor messages.
AEWNOROLL=0 <i>n</i>	Specifies the number of Exception Monitor sampler messages not to roll. <ul style="list-style-type: none">• 0—Specifies that all messages roll. This value is the default.• <i>n</i>—Specifies that <i>n</i> messages roll, where <i>n</i> is a decimal number from 1 to 10.

Table 2-2 Keywords for Member \$\$\$INSYS0 (Part 2 of 5)

Keyword=Value	Description
AEWROLL=YES NO	<p>Defines whether Exception Monitor sampler messages are allowed to roll off the SYSPROG Services console. This keyword is valid in Started Task and Batch modes only.</p> <ul style="list-style-type: none"> • YES—Allows Exception Monitor sampler messages to roll off the SYSPROG Services console. This value is the default. • NO—Does not allow Exception Monitor sampler messages to roll off the SYSPROG Services console.
AEWSTART=00 xx	<p>Defines the suffix for the default PWSCPMxx member containing control statements for Exception Monitor samplers.</p> <ul style="list-style-type: none"> • 00—Uses Exception Monitor control statements in member PWSCPM00 in the BBPARM library. This value is the default. • xx—Uses Exception Monitor control statements in member PWSCPMxx in the BBPARM library.
AEWWTODESCCDE=X'4000' X'hhhh'	<p>Defines the WTO descriptor code for Exception Monitor sampler messages.</p> <ul style="list-style-type: none"> • X' 4000'—Sends WTO messages to descriptor code 2. This value is the default. • X' hhhh' —Is a hexadecimal bit string that corresponds to the ordinal position of route codes 1 through 16.
AEWWTOROUTCDE=X'4020' X'hhhh'	<p>Defines the WTO routing code for Exception Monitor sampler messages.</p> <ul style="list-style-type: none"> • X' 4020'—Sends WTO messages to routing codes 2 and 11. This value is the default. • X' hhhh' —Is a hexadecimal bit string that corresponds to the ordinal position of route codes 1 through 16.
CAPS=OFF ON	<p>Specifies how messages should be displayed.</p> <ul style="list-style-type: none"> • OFF—Messages will be displayed in uppercase and lowercase. This value is the default. • ON—Messages will be displayed in uppercase only.
CMDID=char	<p>Defines an OS/390 subsystem command character. This keyword is valid in Started Task and Batch modes only.</p> <ul style="list-style-type: none"> • char—Is a command identification character to route commands to SYSPROG Services using the OS/390 subsystem interface; valid command identification characters are <p> @ # % ^ & * () _ - + = " . < > / ? ¢</p>

Table 2-2 Keywords for Member \$\$INSYS0 (Part 3 of 5)

Keyword=Value	Description
EOSMSG=NO YES	<p>Specifies whether SYSPROG Services issues an END OF SERVICE message at the completion of every service. This keyword is valid in Started Task, TSO, and Batch modes only.</p> <ul style="list-style-type: none"> • NO—Does not issue an END OF SERVICE message at the completion of every service. This value is the default. • YES—Issues an END OF SERVICE message at the completion of every service.
EXECLOOP=NO YES	<p>Controls whether the EXECUTE service pauses between issuing commands.</p> <ul style="list-style-type: none"> • NO—Causes the EXECUTE service to issue commands without a pause between commands. This value is the default. • YES—Causes the EXECUTE service to issue commands with a pause between commands.
FNQSIZE=12 <i>n</i>	<p>Defines the number of 1K blocks of CSA storage used by Exception Monitor samplers.</p> <ul style="list-style-type: none"> • 12—Specifies twelve 1K blocks of CSA storage. This value is the default. • <i>n</i>—Is a decimal number of 1K blocks of CSA storage.
JES2TPUT=NO YES	<p>Specifies whether JES2 redirects TPUTs.</p> <ul style="list-style-type: none"> • NO—JES2 does not redirect TPUTs. This value is the default. • YES— JES2 redirects TPUTs.
LCLAEW=NORMAL CONSOLE BOTH	<p>Defines where Exception Monitor sampler messages are displayed.</p> <p>When SYSPROG is operating as a TSO command:</p> <ul style="list-style-type: none"> • NORMAL—Causes Exception Monitor sampler messages to be displayed at the TSO terminal. • CONSOLE—Sends Exception Monitor sampler messages to the system console. This value is the default. • BOTH—Sends Exception Monitor sampler messages to both the system console and the TSO terminal. <p>When the Exception Monitor is operating within the MAINVIEW PAS, the WARN view is used to view the warning messages on the console when you specify NORMAL; the CONSOLE and BOTH parameters also cause the messages to be displayed on the system console.</p> <p>When SYSPROG is executed as a started task, the messages are sent only to the system console.</p>
LCLAEWTS=NO YES	<p>Specifies whether Exception Monitor sampler messages have a time stamp.</p> <ul style="list-style-type: none"> • NO—Does not time stamp Exception Monitor sampler messages. This value is the default. • YES—Time stamps Exception Monitor sampler messages.

Table 2-2 Keywords for Member \$\$INSYS0 (Part 4 of 5)

Keyword=Value	Description
LLA=(yy,zz)	<p>Specifies the suffixes of the CSVLLA members used to remove and reinstate the link list data set concatenation from control of the LLA address space. The CSVLLA members reside in the library pointed to by IEFPARM in the LLA address space (by default, SYS1.PARMLIB). This keyword is used in conjunction with the LLIST service.</p> <ul style="list-style-type: none"> yy—Uses member CSVLLAyy to specify the removal of the link list data set concatenation from control of the LLA address space; used if you omit yy on the LLIST command. zz—Uses member CSVLLAzz to place the link list data set concatenation back under control of the LLA address space; used if you omit zz on the LLIST command.
MAXSERVS=3 <i>n</i>	<p>Specifies the maximum number of concurrent services in SYSPROG Services. This keyword is valid in Started Task and Batch modes only.</p> <ul style="list-style-type: none"> 3—Allows up to three concurrent services. This value is the default. <i>n</i>—Allows up to <i>n</i> concurrent services.
MSGID=YES NO	<p>Specifies whether message identification numbers prefix SYSPROG Services messages. This keyword is not valid for TSO mode.</p> <ul style="list-style-type: none"> YES—Message identification numbers prefix all messages. This value is the default. NO—No message identification numbers prefix any messages. <p>Message identification numbers appear in tracking output even if you specify MSGID=NO.</p>
OPRAUTH=NO YES	<p>Defines the need for TSO operator authority for SYSPROG Services that might require TSO operator authority. This keyword is valid for TSO mode only.</p> <ul style="list-style-type: none"> NO—TSO users must have operator authority. This value is the default. YES—TSO users do not need operator authority.
TGETINT=1 <i>n</i>	<p>Specifies the interval between TGETs. This keyword is valid for TSO mode only.</p> <ul style="list-style-type: none"> 1—Issues a TGET every 1 minute. This value is the default. <i>n</i>—Issues a TGET every <i>n</i> minutes.
TPUTINT=1 <i>n</i>	<p>Specifies the interval between TPUTs. This keyword is valid for TSO mode only.</p> <ul style="list-style-type: none"> 1—Issues a TPUT every 1 minute. This value is the default. <i>n</i>—Issues a TPUT every <i>n</i> minutes.
TTSIZE=0 <i>n</i>	<p>Defines the size of the SYSPROG Services trace table.</p> <ul style="list-style-type: none"> 0—Indicates that there is no trace table. This value is the default. <i>n</i>—Allocates a trace table with <i>n</i> entries.

Table 2-2 Keywords for Member \$\$INSYS0 (Part 5 of 5)

Keyword=Value	Description
WQEDISP=0 <i>n</i>	Defines displacement into locally modified WQEs. <ul style="list-style-type: none"> 0—Indicates no displacement into the WQE; this value is typical for most customer sites and is the default. <i>n</i>—Indicates a displacement into the WQE.
WTODESCCDE=X'0000' <i>X' hhhh'</i>	Defines the WTO descriptor code for SYSPROG Services messages. <ul style="list-style-type: none"> X' 0000'—Sends WTO messages to the system log. This value is the default. <i>X' hhhh'</i>—Is a hexadecimal bit string that corresponds to the ordinal position of route codes 1 through 16.
WTORDESCCDE=X'0000' <i>X' hhhh'</i>	Defines the WTOR descriptor code for SYSPROG Services messages. <ul style="list-style-type: none"> X' 0000'—Sends WTOR messages to the system log. This value is the default. <i>X' hhhh'</i>—Is a hexadecimal bit string that corresponds to the ordinal position of route codes 1 through 16.
WTOROUTCDE=X'4020' <i>X' hhhh'</i>	Defines the WTO routing code for SYSPROG Services messages. <ul style="list-style-type: none"> X' 4020'—Sends WTO messages to routing codes 2 and 11. This value is the default. <i>X' hhhh'</i>—Is a hexadecimal bit string that corresponds to the ordinal position of route codes 1 through 16.
WTORROUTCDE=X'4020' <i>X' hhhh'</i>	Defines the WTOR routing code for SYSPROG Services messages. <ul style="list-style-type: none"> X' 4020'—Sends WTO messages to routing codes 2 and 11. This value is the default. <i>X' hhhh'</i>—Is a hexadecimal bit string that corresponds to the ordinal position of route codes 1 through 16.

Example

To prevent SYSPROG Services from prefixing messages with identification numbers, place the following control statement in member \$\$INSYS0:

MSGID=NO

\$\$RPJOBS

This member exempts jobs with constantly outstanding WTORs from the SYSPROG Services outstanding reply scan.

See also the description for “\$\$RPTEXT” on page 2-12.

Syntax Rules

The following syntax rules apply:

- Specify one job name per entry.
- Start each entry in column 1.
- Do not place quotation marks around the job name.

Default

None.

Example

Assume that job IMSDC has a shutdown message outstanding at all times. You can exclude this job from the outstanding reply scan by entering the following statement in member \$\$RPJOBS:

IMSDC

\$\$RPTTEXT

This member exempts constantly outstanding WTORs from the SYSPROG Services outstanding reply scan that contain the specified character strings.

Syntax Rules

The following syntax rules apply:

- Specify one entry per statement.
- Place single or double quotation marks around the message text containing imbedded blanks.
- Enter no more than 24 bytes of message text.

Default

None.

Example

Assume that various jobs might have an outstanding Write To Operator (WTOR) message containing the text `REPLY E TO END`, and you want the REPLIES service and the REP sampler to ignore them. Because the message text contains imbedded blanks, you must enclose the text within either apostrophes or quotation marks. Messages are checked to see if they contain the specified string; therefore, all of the following text would cause the messages to be excluded:

```
"REPLY E TO END"  
"E TO END"  
'LY TO EN'
```

\$\$XENQ

This member specifies major names and minor names to be excluded from the ENQUEUEES service contention display and from the Exception Monitor ENQ sampler warning messages.

Syntax Rules

The following syntax rules apply:

- List each major name and optional minor name as a single statement.
- Separate the major name and optional minor name with a comma.
- Enter as many statements as necessary.

Default

None.

Example 1

To exclude the major names SYSDSN and SPFEDIT from the ENQUEUEES service contention display and from the Exception Monitor ENQ sampler warning messages, place the following statements in member \$\$XENQ:

```
SYSDSN
SPFEDIT
```

Example 2

To prevent the ENQUEUEES asynchronous service and the Exception Monitor ENQ sampler from reporting SYSDSN enqueues that begin with SYS1 ., place the following statement in member \$\$XENQ:

```
SYSDSN,SYS1.
```

PWSCPMxx

This member contains Exception Monitor sampler control statements.

Syntax Rules

The member names have the form PWSCPMxx, where xx is alphanumeric (for example, PWSCPMFF, PWSCPM09, PWSCPMA9). Each member contains control statements specifying Exception Monitor services, their warning intervals, and appropriate threshold specifications.

The following syntax rules apply:

- Separate the Exception Monitor service name from the specifications with a comma or at least one blank.
- Enter comments by placing an asterisk in column 1.

Default

By default, the Exception Monitor listed in member PWSCPM00 is invoked when you begin Exception Monitor sampling.

Example

The following is an example of a member called PWSCPMEX:

```
INT 60
ENQ 5,10
PAG 4,50
AIOR 4,* ,25,A
```

The example contains four Exception Monitor services:

- The first service (INT 60) specifies an interval rate of 60 seconds.
- The second service (ENQ 5,10) requests that warning messages be issued at five-minute intervals if any enqueue conflicts have existed for over 10 minutes.

- The third service (PAG 4, 50) requests that warning messages be issued at four-minute intervals if the paging rate exceeds 50 over the preceding four minutes.
- The fourth service (AIOR 4, *, 25, A) causes warning messages to be issued at two-minute intervals for each address space whose I/O rate exceeds 25 EXCPs per second over the preceding two minutes.

Chapter 3 Using SYSPROG Services

This chapter describes the methods by which you can access SYSPROG services, either through MAINVIEW for OS/390 or as a stand-alone product. It includes the following topics:

Accessing SYSPROG Services	3-3
Accessing Services from the SYSPROG Services Menu Panel.....	3-7
Executing SYSPROG Services from an Operator Console	3-11
Independent Operations	3-12
Understanding SYSPROG Services Command Syntax	3-14

SYSPROG Services provides you with the means to control certain internal aspects of your OS/390 systems. For example, you can display and alter storage, list the DD names used by a job, add modules and SVCs to the Link Pack Area, and perform a variety of other OS/390 system tasks.

If you are running SYSPROG Services through MAINVIEW for OS/390, you can access the services in the following ways:

- From the OS/390, z/OS, and USS Solutions panel, select **SYSPROG**.
- From the SYSPROG Services Easy Menu, EZMSPROG, select **SYSPROG Fast Menu** for an expanded set of options.
- From the OS/390 Easy Menu, select **SYSPROG Services** under the **Utilities** category.
- In TSO line mode, type **SYSPROG** on the **COMMAND** line.
- In Started Task mode, use the **MODIFY (F)** command to invoke a specific service from an operator console.

If you are running SYSPROG Services as a stand-alone product (MAINVIEW SYSPROG Services), you can access the services in the following ways:

- From the OS/390, z/OS, and USS Solutions panel, select **SYSPROG**.
- In TSO line mode, type **SYSPROG** on the **COMMAND** line.
- In Started Task mode, use the **MODIFY (F)** command to invoke a specific service from an operator console.

Accessing SYSPROG Services

You can access SYSPROG Services in different ways. If you are a MAINVIEW for OS/390 customer, you can select it through MAINVIEW for OS/390. Or, you can access SYSPROG Services directly.

Accessing SYSPROG from the OS/390, z/OS, and USS Solutions Panel

Figure 3-1 shows the MAINVIEW Selection panel.

Figure 3-1 MAINVIEW Selection Panel

```

----- MAINVIEW Selection Menu -----

Accessing Services from the SYSPROG Services Menu Panel

An alphabetical list of all available services is displayed on the SYSPROG Services Menu panel, as shown in Figure 3-6 on page 3-7.

To view this panel from SYSPROG Services, type **SYSPROG** on the **COMMAND** line.

To view this panel from MAINVIEW for OS/390, follow these steps:

Step 1 From the OS/390 Easy Menu panel, select **SYSPROG Services**.

Step 2 Type **SYSPROG** on the **COMMAND** line.

The SYSPROG Services Menu panel is displayed, as shown in Figure 3-6.

Figure 3-6 SYSPROG Services Menu Panel

```

Scroll down to display the rest of the services. Each service is described in Chapter 4, “Synchronous Services.”

Performing Functions

You can perform the following actions from the SYSPROG Services Menu panel list:

- Locate a service.
- Find out more about a service.
- Execute a service.

Table 3-1 summarizes the functions of the SYSPROG Services commands L, S, E, and MODIFY; subsequent sections in this chapter provide more details.

Table 3-1 Available SYSPROG Services Commands

To	Do This	For More Information, See
Search for a service by name.	Type L service name .	"Locating a Service"
Find out more about a service, or change its parameters	Use the S line command.	"Finding Out More about a Service" on page 3-9
Execute a service	Choose one: <ul style="list-style-type: none"> • Use the E line command (using defaults). • On the COMMAND line, type the name of the service and its parameters. • Use the S line command, specify the parameters on the Service Information panel, and press Enter. 	"Executing a Service" on page 3-9
Execute a service from an operator console	Choose one: <ul style="list-style-type: none"> • Use the MODIFY command. • Use a predefined CMDID character. 	"Executing SYSPROG Services from an Operator Console" on page 3-11

Locating a Service

To locate a service—for example, LNKLIST—type **L LNKLIST** on the **COMMAND** line. LNKLIST is scrolled to the top of the display.

Finding Out More about a Service

To find out more information about a service, place the cursor next to the desired service, type an **S** (Select), and press **Enter**. The appropriate Service Information panel is displayed, describing the service and providing input fields in which you can specify parameters.

Figure 3-7 shows the Service Information panel for the DVIEW service.

Figure 3-7 Service Information Panel for DVIEW

```

----- SYSPROG - DVIEW Service -----
COMMAND ==>

                                More:      +

OPTION  ==> 10                (CCHHR, DSN, DSCB,
                                EXTENTS, FILES or LABEL)
VOLSER  ==>                  (Volume serial number of
                                DASD device to view)

Required for CCHHR:
ADDRESS ==>                  (Absolute track address,
                                format cccchhhrrr)

Required for DSN, DSCB or EXTENTS;
optional partial DSname for FILES:
DSNAME  ==>

Optional for DSN:
SKIP    ==>                  (Number of blocks to
                                skip--default 0)
COUNT  ==>                  (Number of blocks to
                                display--default 1)

Press ENTER to execute service

```

To execute the service from the Service Information panel, type values in the parameter input fields, if desired, and press **Enter**. Otherwise, use **END** to exit the panel.

Executing a Service

To execute a service from the SYSPROG Services Menu, do one of the following actions:

- On the **COMMAND** line, type the name of the service and its accompanying parameters.
- Type **E** (Execute) to the left of the service and press **Enter**.
- Type **S** (Select) to the left of the service and press **Enter**. Specify the parameters on the Service Information panel, and press **Enter**.

The output for that service appears in the SYSPROG Services Output panel.

Figure 3-8 shows the SYSPROG Services Output panel after the DVIEW service is executed.

```

The SYSPROG Services Output panel displays the output for all services, with the most recently executed service positioned at the bottom of the display. You can scroll up or down within the panel and invoke other services by typing the appropriate name and parameters on the **COMMAND** line.

Executing SYSPROG Services from an Operator Console

You can invoke SYSPROG Services from an OS/390 operator console by using the MODIFY (F) command or a predefined CMDID character.

Using the MODIFY (F) Command

Specify the MODIFY (F) command in this format:

F *pasname*,**R**=*sysprog_service*

where *pasname* is the name of the PAS and *sysprog_service* is the name of the service that you want to invoke, along with any parameters the service might require.

Using a CMDID Character

You can define a CMDID character in the JCL for the OS/390 PAS.

If you already defined a CMDID character in the OS/390 PAS JCL, you can invoke SYSPROG Services by preceding the service name with *two* of the defined CMDID characters. The pair of characters tells the system to invoke SYSPROG Services, as R= does in the previous example. The two characters must be the same.

Type the command in this format:

*******sysprog_service*

where * is any valid CMDID character.

For example, if you specified **CMDID=#** in the OS/390 PAS JCL, you could type **##INFO** at the console to invoke the INFO service.

Valid CMDID Characters

The following characters are valid CMDID characters. They can be specified as a single character, a single character in quotation marks, or a hexadecimal equivalent (two digits).

¢ . < (+ | & ! *) ¬ - / % _ > ? : # @ ' = "

Independent Operations

SYSPROG Services has the ability to operate independently from MAINVIEW for OS/390 as a started task (STC) or as a TSO command (in Line mode).

Executing SYSPROG Services as a Started Task

When SYSPROG Services is executed as a started task (STC), it receives commands from an operator console and sends the response to that console. Commands can be entered in response to an outstanding WTO prompt using an operator MODIFY command or using a command identification character. The specific method is determined by options specified in BBPARM member \$\$INSYS0 and the presence (or absence) of member \$\$INNWT0. See Chapter 2, “Controlling the SYSPROG Services Environment,” for details.

BBSAMP member SYSPROGJ contains a sample procedure for executing SYSPROG Services as a started task, which you can copy to a cataloged procedure data set. This member also contains an explanation of each DD statement contained in the procedure.

Note: It is possible to start SYSPROG Services prior to starting the Job Entry Subsystem (JES), if desired. However, if you do, all referenced cataloged data sets must be cataloged in the Master catalog. Furthermore, SYSOUT data sets cannot be used since they require JES services.

Executing Services in Started Task Mode

If you are running SYSPROG Services in Started Task mode, you can enter commands using the MODIFY (F) command. For example, to invoke the CPU service, type

F jobname|ID,CPU

Using MODIFY (F) to enter commands in Started Task mode is recommended for these reasons:

- The current outstanding reply number does not have to be found; thus, you can enter the command faster and with less chance of syntax error.
- The output from the service returns only to the console from which the service was invoked.

A console must have **SYS** or **ALL** authority before commands can be executed through **MODIFY**. The message **CONSOLE NOT AUTHORIZED** is displayed if the authority has not been assigned.

After you use **MODIFY (F)** to enter a command, **SYSPROG Services** responds with

```
AMT00DI ENTER SYSPROG Services COMMAND (sid)
```

You can enter up to 16 **MODIFY** commands simultaneously. If you attempt to enter more than 16 **MODIFY** commands, the message **MODIFY REJECTED TASK BUSY** is displayed.

SYSPROG Services as a TSO Command

To invoke **SYSPROG Services** in **TSO Line** mode, you can issue *one* of the following commands:

- At the **TSO READY** prompt, type **SYSPROG**.
- From an **ISPF COMMAND** line, type **TSO SYSPROG**.
- From **ISPF Option 6**, type **SYSPROG**.

The following message is displayed:

```
AMTIN1I SYSPROG SERVICES INITIALIZED RELEASE v.r.mm  
AMT001A SYSPROG
```

You can now issue **SYSPROG Services** commands. If you need to see a list of the commands, type **HELP** at the **AMT001A SYSPROG** prompt on the **COMMAND** line.

To display the last service used, type **?** at the **AMT001A SYSPROG** prompt.

To repeat the last service, type *****.

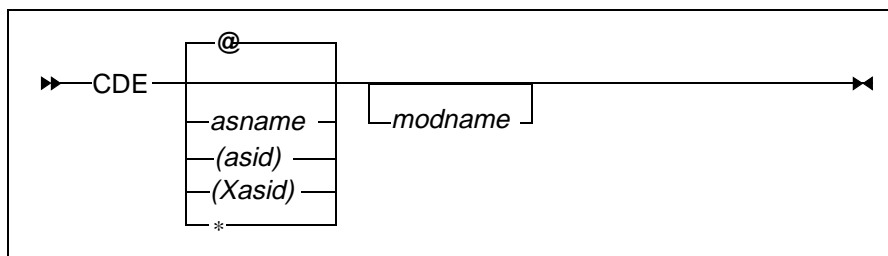

To terminate the **SYSPROG Services** command, type **END** at the **AMT001A SYSPROG** prompt.

Warning! In order for **SYSPROG Services** to run in the **TSO** environment, you must set the authorization through **AutoCustomization** or through manual customization.

In **AutoCustomization**, select the step with the description **Authorize SYSPROG to run in a TSO environment**. Refer to the *MAINVIEW SYSPROG Services Customization Guide* for information on how to complete this step manually.

Understanding SYSPROG Services Command Syntax

The descriptions of services in Chapter 4, “Synchronous Services,” use diagrams to illustrate command syntax. (See “Syntax Diagrams” on page xvi for information on how to read syntax diagrams.) For example, the syntax for the CDE service is shown in the following diagram.

Note: The examples in this section use the CDE service to demonstrate command syntax, but the syntax rules described here are applicable to all services.

The diagram indicates that the CDE service accepts two positional parameters: *asname*, a representation of the address space name (which can be the actual address space name, the address space identifier in decimal or hexadecimal format, * for the last address space entered, or @ for your own address space) and *modname* which, when specified, displays information about a single module.

When you invoke a service from the **COMMAND** line, in most cases you can use either a blank space or a comma to separate the service name and the parameters. (For clarity, the syntax diagrams in this book do not show commas between parameters.)

For example, both of these service commands are valid:

cde inventory

cde,inventory

If you want to issue a command with the default value for a parameter, you do not have to actually type a value for that parameter. For example, this command

cde

displays CDE information about all modules in your own address space (since your own address space is the default for the *asname* parameter).

The CDE service also allows you to display information about a single module by specifying the *modname* parameter after the *asname* parameter, such as

cde inventory ieavtsdt

This command displays information about the module IEAVTSDT in the address space INVENTORY.

Using Commas as Placeholders for Default Values

If you want to display information about a specific module in your own address space (the default), you do not have to type your address space name. However, you must insert commas as placeholders for the *asname* parameter, as shown here:

cde,,ieavtsdt

Most SYSPROG Services parameters are positional; for example, in the CDE service, SYSPROG Services would expect to find *asname* as the first parameter and the *modname* as the second parameter. If you type a value for *modname* without using commas as placeholders for *asname*, SYSPROG Services interprets the module name as an address space name, and you are likely to get an error message.

Chapter 4 Synchronous Services

The synchronous services offered by SYSPROG Services help improve and increase productivity by allowing you to manipulate various OS/390 internals. This chapter provides detailed information about synchronous services, including proper syntax, required and optional parameters, and usage examples. For information on using the Services Menu, see Chapter 3, “Using SYSPROG Services.”

This chapter includes the following topics; the services marked with an asterisk are distributed with and available from the AutoOPERATOR product:

ALLOCATE

The ALLOCATE (ALL) service allocates a particular device to prevent allocation of the device by the operating system.

Syntax

where

dvn Is the hexadecimal device number of the device.

Example

To allocate device 180, type

```
ALL 180  
  
AMTA11I    DEVICE 180 ALLOCATED
```

Note: ALLOCATE sets bits UCBALOC, UCBONLN, and UCBRESV in the UCBSTAT field for the device specified.

APF

The APF (AP) service dynamically updates the APF list. Use the APF service to list, add, delete, change, or restore entries in the APF list without having to wait for the next IPL.

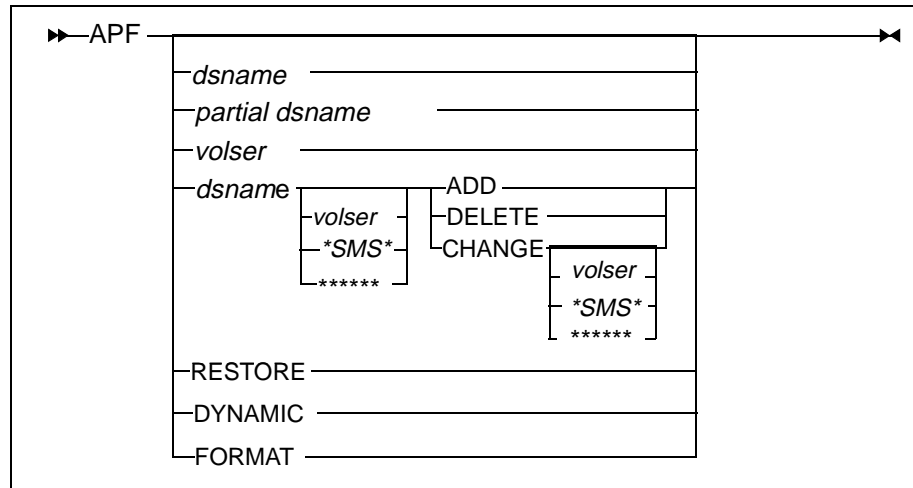

This service

- lists the current authorized program libraries and their volume serial numbers
- selectively lists libraries by data set name, partial data set name, or volume serial number
- adds a new entry to the APF list; authorizes link list data sets that were not authorized at IPL
- deletes an entry from the APF list
- changes the volume serial number for an entry in the APF list
- changes the format of the APF list from STATIC to DYNAMIC
- displays the APF list format (STATIC or DYNAMIC)
- restores the APF entries created by the nucleus initialization program (NIP) at IPL

The APF service provides many features that are not available through the operating system:

- the ability to change the volume serial number for an entry in the APF list
- the ability to selectively modify the link list after adding or deleting an entry from the APF list
- the option to omit the volser on any command; unlike the SETPROG command and the CSVAPF macro, which require the specification of a volser, the APF service scans the catalog for the correct volser if one is not specified
- protection for a DYNAMIC APF list if it was modified through the APF service
- the ability to restore the STATIC APF list created by the NIP without using the SETPROG command

Syntax

where

<i>dsname</i>	Is the data set name of the authorized library.
<i>partial dsname</i>	Represents the first characters of a data set name. For instance, if you type APF RXA15 , the service lists every data set that has a prefix of RXA15.
<i>volser</i>	Is the volume serial number. All the authorized libraries that reside on this volume are displayed.
<i>dsname volser</i>	Is the data set name and volume serial number. <ul style="list-style-type: none"> • If a volser is not specified, the cataloged volser for the data set is used. • If *SMS* is specified as the volser, SMS will manage the data set. • If ***** is specified as the volser, the system residence volume is used.
ADD	Adds the specified data set on the specified volume to the APF list.
DELETE	Deletes the specified data set from the APF list.
CHANGE	Changes the volser on which the data set resides to the volume that follows. <ul style="list-style-type: none"> • If a volser is not specified, the cataloged volser for the data set name is used. • If *SMS* is specified as the volser, SMS will manage the data set. • If ***** is specified as the volser, the system residence volume is used.
RESTORE	Restores the NIP-created APF list, as long as that list was in STATIC format. It cannot be used if the NIP created the APF list in DYNAMIC format, as DYNAMIC lists cannot be restored.

DYNAMIC	Switches the APF format from STATIC to DYNAMIC. (This command is the equivalent of the IBM SETPROG APF,FORMAT=DYNAMIC command.)
FORMAT	Displays the format of the APF list (STATIC or DYNAMIC) and indicates whether or not this format can be changed.

Note: The APF service creates a new APF list in SQA storage. The NIP-created APF list remains. If an error occurs, the NIP-created APF list can be restored using the RESTORE option. Changes are valid until the next IPL.

Examples

The following examples illustrate the ways to invoke the APF service.

List Example

To list all entries in the APF list, type

```
apf
                                ①      ②
AMTA71I  APF LIST AT LOCATION 01B08000 HAS 201 ENTRIES
                                ③      ④
AMTA72I  VOLUME OPNS00      DSN RES1.RES31.BBLINK
```

Legend:

1. Hexadecimal address of the APF list in storage.
2. APF list.
3. Volser of the authorized library, *SMS*, or *****.
4. Data set name of the authorized library.

Note: The APF service repeats message AMTA72I for every entry in the APF list.

To list all APF entries that start with RES1, type

```
apf res1

AMTA77I  THE FOLLOWING ENTRIES MATCHED THE REQUEST
AMTA72I  VOLUME OPNS00      DSN RES1.RES31.BBLINK
```

To list all APF entries for any data set on volser OPNS00, type

```
apf,,opns00
```

```
AMTA72I    VOLUME OPNS00      DSN RES1.RES30.BBLINK
```

Note the two commas, indicating omission of the first parameter.

Add Example

To create a new entry in the APF list for RES1.RES30.BBLOAD, residing on OPNS01, type

```
apf res1.res30.bbload opns01 add
```

```
AMTA73I    APF LIST NOW CONTAINS ENTRY FOR
AMTA72I    VOLUME OPNS01      DSN RES1.RES30.BBLOAD
AMTAXGA    ENTER Y TO SET UP AUTHORIZATION IN LINKLIST FOR DATA SET
```

To create a new entry in the APF list for a cataloged data set, type

```
apf res1.res30.bbload,,add
```

```
AMTA73I    APF LIST NOW CONTAINS ENTRY FOR
AMTA72I    VOLUME OPNS01      DSN RES1.RES30.BBLOAD
AMTAXGA    ENTER Y TO SET UP AUTHORIZATION IN LINKLIST FOR DATA SET
```

The APF service determines where RES1.RES30.BBLOAD is cataloged and creates a new APF list with the entered data set and the cataloged volser.

To add a data set to the APF list and have the data set managed by SMS, type

```
apf res1.user.file *sms* add
```

```
AMTA73I    APF LIST NOW CONTAINS ENTRY FOR
AMTA72I    VOLUME *SMS*      DSN RES1.USER.FILE
AMTA7MI    SMS MANAGED DATASET RES1.USER.FILE
AMTAXGA    ENTER Y TO SET UP AUTHORIZATION IN LINKLIST FOR DATA SET
```

Note: If you do not want the data set to appear in the link list, type any character *other than Y*.

Delete Example

To remove an entry from the APF list, type

```
apf res1.res30.bbload opns01 delete
```

```
AMTA74I    APF LIST ENTRY DELETED FOR
AMTA72I    VOLUME OPNS01      DSN RES1.RES30.BBLOAD
```

Change Example

To change the volser of an existing APF entry, type

```
apf res1.res30.bbload opns01 change perf01
```

```
AMTA75I    APF LIST ENTRY CHANGED. OLD VOLUME SER OPNS01 IS NOW
AMTA72I    VOLUME PERF01      DSN RES1.RES31.BBLOAD
AMTA7JI    ENTER Y TO CONTINUE WITH AUTHORIZATION REQUEST
```

Restore Example

To restore the APF list to the original list created by NIP at IPL, type

```
apf restore
```

```
AMTA79I    THE NIP-CREATED APF LIST HAS BEEN RESTORED
```

Only STATIC NIP-created APF lists may be restored. If you try to use the APF RESTORE command on a NIP-created DYNAMIC list, this message is displayed:

```
apf restore
```

```
AMTAXSP    NIP-CREATED DYNAMIC APF LIST CANNOT BE RESTORED; CONTACT IBM
```

If you try to restore a STATIC APF list that has not changed since it was created by the NIP, this message is displayed:

```
apf restore
```

```
AMTAXNL    CURRENT APF LIST HAS NOT BEEN CHANGED; NO NEED TO RESTORE
```

Dynamic Example

To change the format of the APF list from STATIC to DYNAMIC, type

apf dynamic

AMTAXCF THE APF LIST FORMAT HAS BEEN CHANGED FROM STATIC TO DYNAMIC

To use the APF DYNAMIC command, DFSMS/MVS must be installed on your system. If it is not, this message is displayed:

apf dynamic

AMTAXEV APF FORMAT CANNOT BE CHANGED. DFSMS/MVS IS NOT INSTALLED.

Format Example

To display the format of the current APF list, type

apf format

①

AMTAXFI APF LIST IS IN STATIC FORMAT.

Legend:

1. Format of the APF list: STATIC or DYNAMIC.

If the NIP created the APF list in DYNAMIC format, the following two messages are displayed:

apf format

AMTAXFI APF LIST IS IN DYNAMIC FORMAT.
AMTAXNA STATIC APF FORMAT NOT AVAILABLE.

A STATIC list is never available if the NIP-created list was DYNAMIC. However, suppose that the NIP-created list was STATIC but the APF list is currently DYNAMIC. You would see these messages:

apf format

```
AMTAXFI    THE APF LIST IS IN DYNAMIC FORMAT.  
AMTAXAS    STATIC APF FORMAT AVAILABLE.
```

Syntax

MAP	Provides a detailed display of the VIO and non-VIO page slots owned by each job.
<i>n</i>	Produces MAP output for address spaces that own <i>n</i> or more non-VIO page slots.
NAME	Sorts MAP output by address space name in alphabetical order.
VIO	Sorts MAP output in descending order by the number of VIO slots per address space. The 10 highest users of VIO slots are displayed.
NVIO	Sorts MAP output in descending order by the number of non-VIO slots per address space. The 10 highest users of non-VIO slots are displayed.

Examples

To display information about auxiliary storage and paging data sets, type

asm

```
AMTA5CI LAST IPL WAS COLD START (CLPA)
AMTA51I ASMTVT 00FD9C30          ①
AMTA52I TOTAL LOCAL SLOTS 490650 AVAILABLE 353914 = 72 percent ②
AMTA5DI LARGEST HOLDER OF SLOTS IS PAS WITH 1% ▸
AMTA53I D/S 0 ( 251 BOOLE1) PLPA SIZE 2600 FREE 1006 = 38% BURST 10
                                         ④
AMTA53I D/S 1 ( 251 BOOLE1) COMN SIZE 1300 FREE 873 = 67% BURST 10
AMTA56I D/S 2 (NOT IN USE) DUPLX ⑤
AMTA53I D/S 3 ( 541 BABP01)*LOCAL SIZE 13650 FREE 12308 = 90% BURST 30
AMTA53I D/S 4 ( 544 BABP02) LOCAL SIZE 13650 FREE 12113 = 89% BURST 30
AMTA56I D/S 5 (NOT IN USE) LOCAL
AMTA57I D/S 6 (NOT IN USE BECAUSE OF ERRORS) ⑥
AMTA58I                               * = NOT ELIGIBLE FOR VIO USE ⑦
```

Legend:

1. Hexadecimal address of the ASMTVT.
2. Total number of page slots for user paging, the actual number of slots currently free, and the percentage of slots currently free.
3. Address space holding the largest number of slots.
4. One line for each page data set.

For each active data set, MAINVIEW for OS/390 message AMTA53I displays the

- device and volume serial numbers
- usage class (such as PLPA, LOCAL, DUPLX, COMN, or UNKN)
- size of the data set in page slots
- percentage of page slots currently available
- actual number of page slots currently available

5. Message AMTA56I is issued for a page data set when SYS1.PARMLIB member IEASYS.xx
 - defines the page data set, but the data set was not available during an IPL
 - does not include the DUPLEX parameter, or the DUPLEX parameter specifies a data set that was not available during an IPL (the system is always prepared for a duplex data set)
6. Message AMTA57I identifies page data sets that were deactivated because of I/O errors.
7. An asterisk denotes page data sets that are not eligible for VIO paging.

To list the number of VIO and non-VIO page slots owned by each job, type

asm map

```

AMTA5CI LAST IPL WAS COLD START (CLPA)
AMTA51I ASMVT 00FD9C30

AMTA54I DEC3 OWNS 0 VIO 1798 NON-VIO SLOTS
AMTA54I DJMC4 OWNS 0 VIO 1643 NON-VIO SLOTS

```

Legend:

1. Output is sorted in descending order by the number of non-VIO slots.

ASVT

The ASVT service displays information for three address space queues maintained in the ASVT control block. They are

- available queue
- non-reusable replacement queue
- Start/SASI queue

Each queue displays the following information:

- current number of slots (ASIDs) on the queue
- percentage of original number of slots (ASIDs) on the queue
- original number of slots (ASIDs) on the queue
- name of system parameter that defined the original queue length

When the system marks an ASID as non-reusable, it replaces the ASID by transferring a slot from the non-reusable replacement queue to the available queue until the replacement queue is empty. If an attempt is made to start a started task and the available queue is empty, an ASID on the Start/SASI queue is used.

Syntax

Example

To display information for the three address space queues, type

asvt

AMTAV1I	DESCRIPTION	CURRENT	PERCENT	ORIGINAL	PARAMETER
AMTAV2I	-----	-----	-----	-----	-----
AMTAV3I	AVAILABLE QUEUE	225	45.00	500	MAXUSER
AMTAV3I	NON-REUSABLE REPLACEMENT QUEUE	43	28.66	150	RSVNONR
AMTAV3I	START/SASI QUEUE	25	100.00	25	RSVSTRT
AMTAV4I	NUMBER OF NON-REUSABLE ASID	107			

AUTHTSO

The AUTHTSO (AU) service

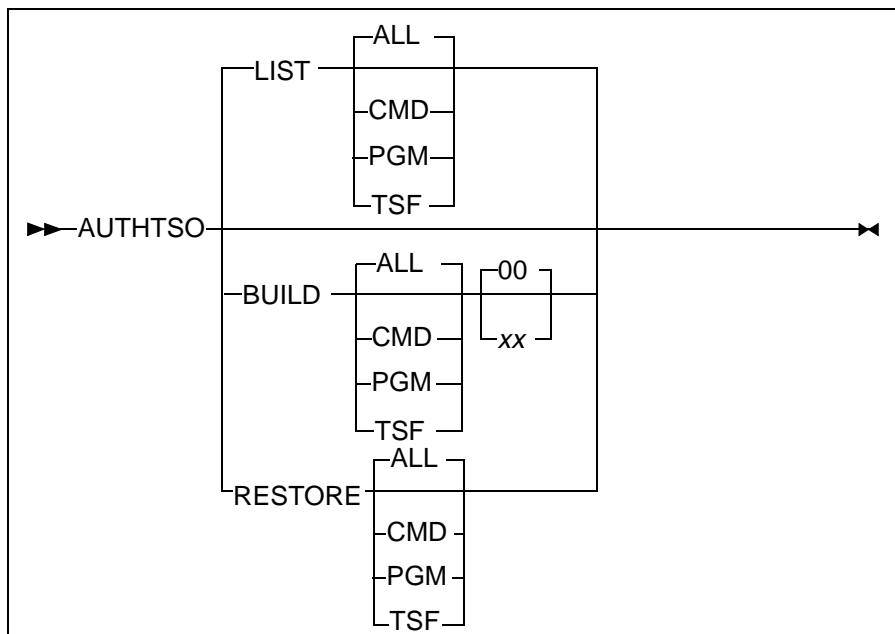

- lists the contents of the current authorization lists
- builds a new authorization list from any IKJTSOxx member in SYS1.PARMLIB
- restores the authorization list built at IPL

Use the AUTHTSO service to modify the contents of the TSO authorization lists for the duration of the current IPL. This service eliminates the need to IPL and lets you test updates before entering them into production. The AUTHTSO service is valid for TSO/E version 1.4 or later.

TSO authorization lists define which TSO commands or programs can be invoked with APF authorization. AUTHTSO accesses each TSO authorization list independently of the other lists. The three types of TSO authorization lists are as follows:

- AUTHCMD (CMD)—authorized TSO commands
- AUTHPGM (PGM)—authorized TSO programs
- AUTHTSF (TSF)—APF-authorized programs that can be called through the TSO Service Facility (TSF)

Syntax

where

LIST	Lists the contents of the current authorization list.
BUILD	Builds a new authorization list from any IKJTSOxx member in SYS1.PARMLIB; 00 is the default.
RESTORE	Restores the authorization list built at the time of IPL.
ALL	Applies the appropriate command to all three lists: TSO commands, programs, and Service Facility.
CMD	Specifies authorized TSO commands. You can substitute AUTHCMD, IKJEFTE2, or E2 for CMD.
PGM	Specifies authorized TSO programs. You can substitute AUTHPGM, IKJEFTE8, or E8 for PGM.
TSF	Specifies the TSO Service Facility. You can substitute AUTHTSF, IKJEFTAP, or AP for TSF.
xx	Is the suffix of SYS1.PARMLIB member IKJTSOxx.

Examples

The following examples illustrate the ways to invoke the AUTHTSO service.

List Examples

To display the authorization list of TSO commands (CMD), type

```
authtso list cmd
                                ①
AMTAT7I AUTHORIZED COMMAND LIST (IKJEFTE2) -
                                ②                ③
AMTAT7I BUILT DURING IPL AT 02:16 ON 96.015:
AMTATZI
AMTAT8I RECEIVE  TRANSMIT XMIT    LISTD ④
AMTAT8I SEND     RACONVRT SYNC    RESOLVE ④
```

Legend:

1. Type of authorization list (COMMAND, PROGRAM, or APF-TSF).
2. Process by which the authorization list was built (IPL or AUTHTSO).
3. Time and date the authorization list was created.
4. Commands in the specific authorization list.

To display all authorization lists, type

```
authtso

AMTAT7I AUTHORIZED COMMAND LIST (IKJEFTE2) -
AMTAT7I BUILT DURING IPL AT 02:16 ON 96.022:
AMTATZI
AMTAT8I RECEIVE  TRANSMIT XMIT    LISTD
AMTAT8I SEND     RACONVRT SYNC    RESOLVE
AMTATZI
AMTAT7I AUTHORIZED PROGRAM LIST (IKJEFTE8) -
AMTAT7I BUILT DURING IPL AT 02:16 ON 96.022:
AMTATZI
AMTAT8I IEBCOPY  SPFCOPY  IKJEFF76 RESOLVE
AMTAT8I ICHUT100 ICHUT200 ICHUT400
AMTATZI
AMTAT7I AUTHORIZED APF-TSF LIST (IKJEFTAP) -
AMTAT7I BUILT DURING IPL AT 02:16 ON 96.022:
AMTATZI
AMTAT8I IEBCOPY  SPFCOPY  IKJEFF76
```

Build Example

Refer to the appropriate IBM manual for syntax rules for the IKJTSOxx member.

To build a new authorization list of TSO commands from SYS1.PARMLIB member IKJTSO01, type

```
authtso build ikjefte2 01
```

```
AMTAT9A REPLY Y TO CONFIRM "BUILD" OF TSO CMD LIST, N TO CANCEL
```

```
Y
```

```
AMTATBI TSO CMD LIST (IKJEFTE2) BUILT
```

Restore Example

To restore all authorization lists to their status at IPL, type

```
authtso restore all
```

```
AMTAT9A REPLY Y TO CONFIRM RESTORE OF TSO CMD LIST, N TO CANCEL
```

```
Y
```

```
AMTATBI TSO CMD LIST (IKJEFTE2) RESTORED
```

```
AMTAT9A REPLY Y TO CONFIRM RESTORE OF TSO PGM LIST, N TO CANCEL
```

```
Y
```

```
AMTATBI TSO PGM LIST (IKJEFTE8) RESTORED
```

```
AMTAT9A REPLY Y TO CONFIRM RESTORE OF TSO TSF LIST, N TO CANCEL
```

```
Y
```

```
AMTATBI TSO TSF LIST (IKJEFTAP) RESTORED
```

Usage Notes

- The AUTHTSO service prompts you for a response before it updates each of the three authorization lists. To restore the original authorization list, type **Y** in response to message AMTAT9A.
- To use the original authorization list, you must log off and then log back on to TSO after AUTHTSO restores the list. TSO creates a static copy of the authorization list in your TSO address space when you log on.
- Prior to TSO/E version 1.3, authorization lists were implemented as lists in load module IKJTABLS. Each table was located by way of an entry point. The list names in IKJTSOxx and their corresponding entry points in IKJTABLS are as follows:

List Name	Entry Point
AUTHCMD	IKJEFT2
AUTHPGM	IKJEFT8
AUHTSF	IKJEFTAP

The entry point names are retained in the list headers built from IKJTSO_{xx}.

BBXS

The BBXS (BBX) service displays the status of the BMC Software subsystem services. When diagnosing problems, BMC Software Support staff might ask you to use the BBXS service to verify information about the subsystem.

Syntax

where

BBXS	Displays information about the BBXS subsystem; the default.
<i>subsystemID</i>	Displays information about the specified BMC Software subsystem service (when it is named something other than BBXS).

Examples

To display information about the BBXS subsystem, type

```
bbxs

AMTBXAD BBX Subsystem Information
AMTBXDD =====
AMTBX2D Subsystem name=BBXS; SSCT=00BD3270 ## AUTOINIT ##
AMTBX3D BBCT addr=00B5A000; restart count=01; RMID=BPB1160 , LEVEL=0005
AMTBX5D Initialized by ITSTNPAS (mod=CX10SDVR,key=4) at 03:49:32 on 12/17/95
AMTBX6D BBX was loaded from BB.ITSTN.BBLINK
AMTBX4D Previous BBCT Addr=00B9F000; RMID=BPB1144 , level=0005 ## AUTOINIT ##
AMTBX5D Initialized by DC$BBI (mod=ASTXA1MN,key=8) at 03:47:48 on 12/17/95
AMTBX6D BBX was loaded from SYSO.$BBPROD.BBLINK
```

Legend:

1. Name of the BMC Software subsystem service currently running.
2. Address of the Subsystem Services Control Table (SSCT).
3. Address of the BMC Software Subsystem Services Control Table (BBCT).
4. Number of times that the subsystem was restarted.
5. RMID of the subsystem.
6. Name of the address space that created the subsystem.
7. Module or program that created the subsystem.
8. TCB key of the address space that created the subsystem.
9. Time that the subsystem was created.
10. Date that the subsystem was created.
- ❶ Data set from which the subsystem modules were loaded.
- ❷ Information about the previously loaded BBCT.

CDE

The CDE service lists all the modules loaded in a specified address space and displays information about them from the directory entries.

Syntax

where

@	Specifies your own address space; the default.
asname	Is the address space name.
(asid)	Is the address space identifier in decimal format.
(Xasid)	Is the address space identifier in hexadecimal format.
*	Specifies the last address space entered.
modname	Limits the display to the specified module.

Examples

There are two forms of output, controlled by the presence or absence of a “D” in the third parameter position. When “D” is specified, the hexadecimal contents of the three attributes bytes are displayed rather than decoding the major attribute values.

Example 1 (without D)

To display information about modules in address space PCAUTH, type

cde,pcauth

Legend:

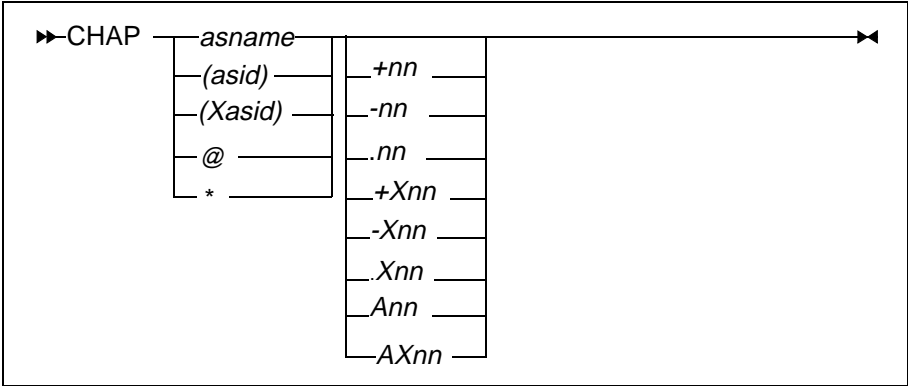

1. Name.
2. Module entry point address.
3. Module use count.
4. List of primary attribute flags that are on.
5. Address of the Contents Directory Entry (CDE).

CHAP

The CHAP (CHA) service helps you manage jobs by changing the internal dispatching priority of an address space.

Note: CHAP is not supported in goal mode. See the service “ESCLASS” on page 4-72.

Syntax

where

<i>asname</i>	Is the address space name.
<i>(asid)</i>	Is the address space identifier in decimal format.
<i>(Xasid)</i>	Is the address space identifier in hexadecimal format.
@	Specifies your own address space.
*	Specifies the last address space entered.
<i>+nn</i>	Adds <i>nn</i> to the current dispatching priority of the address space.
<i>-nn</i>	Subtracts <i>nn</i> from the current dispatching priority of the address space.
<i>.nn or Ann</i>	Sets <i>nn</i> as the absolute priority of the address space.
	Note: If your terminal does not allow you to use the period (.), use the character A in place of the period.
<i>+Xnn</i>	Adds hexadecimal <i>nn</i> to the current dispatching priority of the address space.
<i>-Xnn</i>	Subtracts hexadecimal <i>nn</i> from the current dispatching priority of the address space.

.Xnn or AXnn Sets hexadecimal *nn* as the absolute priority of the address space.

Note: If your terminal does not allow you to use the period (.) to set this value, use the character A in place of the period.

Examples

To increase the internal dispatching priority of address space INVENTORY by three, type

chap inventory +3

		①	②	③		④		⑤	
AMTX11I	JOB	201	INVENTORY	STEP1	PRTY	AF (175)	PGP	2/ 1	
						⑥			
AMTX11I	JOB	201	INVENTORY	STEP1	PRTY	AF (175)	PGP	2/ 1	

Legend:

1. JES job ID.
2. Jobname.
3. Current stepname.
4. Old dispatching priority.
5. Performance group and period.
6. New dispatching priority.

If you do not specify a new dispatching priority, you are prompted for one. For example, to change the absolute priority of address space INVENTORY to 253, type

chap inventory

```
AMTX11I JOB 201 INVENTORY STEP1 PRTY AF (175) PGP 2/ 1
AMTX12A ENTER CHANGE VALUE AS +NN, -NN, .NNN, OR ANNN FOR ABSOLUTE
.253 ①
AMTX11I JOB 201 INVENTORY STEP1 PRTY FD (253) PGP 2/ 1
```

Legend:

1. Priority change, as typed by the user.

Usage Notes

- The CHAP service changes the priority of the entire address space (ASCBCHAP), which effectively changes all tasks in the address space.
- The priority change remains in effect only for the life of the current job step.
- If you type **END** when you are prompted for the priority change, the service ends with no priority change.

CLEAR

The CLEAR (CLE or CLR) service clears system dump data sets without printing the information. Use the CLEAR service in conjunction with the SDUMP service (which takes an SVC dump of one or more address spaces) and the SYSDUMP service (which lists the SVC dump data sets). See “SDUMP” on page 4-188 and “SYSDUMP” on page 4-220 for more information.

Note: System-generated dump data set names are not supported by this service.

Syntax

where

ALL	Clears all system dump data sets; the default.
<i>id</i>	Is a one- or two-digit number representing the system dump data set to be cleared.
PROMPT	<p>Lists the title of the dump contained in each full dump data set processed. In addition, the system issues a confirmation message.</p> <p>Valid responses to the confirmation message are as follows:</p> <ul style="list-style-type: none">• Y—Clears the system dump data set.• E—Terminates the CLEAR service. <p>If you type any character other than Y or E, the current system dump data set will be bypassed and the next full system dump data set (if any) will be processed.</p>

Example

To clear the system dump data set #01, type

```
clear 01
```

```
AMTC50I SYS1.DUMP01 WAS FILLED AT 10:20 ON JAN 21, 1996①
```

```
AMTC51I SOURCE=SVCDUMP ②
```

```
AMTC52I TITLE=LOW CORE OVERLAY (LOOP) ③
```

```
AMTC50A ENTER Y TO CLEAR SYS1.DUMP01 ④
```

```
Y
```

```
AMTC53I 'SYS1.DUMP00' DATA SET CLEARED ⑤
```

```
AMTC5AI CLEAR          PROCESSING COMPLETE
```

Legend:

1. When the specified dump was taken.
2. System component that took the dump.
3. Title of the dump.
4. Operator verification required before the specified data set is cleared.
5. Dump data set has been successfully cleared.

Usage Notes

- You can omit the first operand without using delimiting commas.
- You can abbreviate the operands this way:

A—ALL

N—NOPROMPT

Y—PROMPT

COMMAND

The COMMAND (COM) service executes operator commands from a TSO terminal. This service helps you solve system problems from a TSO terminal rather than an operator's console.

Syntax

```
▶▶ COMMAND — command —▶▶
```

where

command Is the operator command.

Example

To execute the command D U,TAPE, type

com,d u,tape

```
AMTC22I IEE457I 06.38.19 UNIT STATUS 250
AMTC22I UNIT TYPE STATUS          VOLSER  VOLSTATE
AMTC22I 01A0 3490 OFFLINE                /REMOV
AMTC22I 01A1 3490 OFFLINE                /REMOV
AMTC22I 01A2 3490 OFFLINE                /REMOV
AMTC22I 01A3 3490 OFFLINE                /REMOV
AMTC22I 01A4 3490 OFFLINE                /REMOV
AMTC22I 01A5 3490 OFFLINE                /REMOV
AMTC22I 01A6 3490 OFFLINE                /REMOV
AMTC22I 01A7 3490 OFFLINE                /REMOV
AMTC22I 01A8 3490 OFFLINE                /REMOV
AMTC22I 01A9 3490 OFFLINE                /REMOV
AMTC22I 01AA 3490 OFFLINE                /REMOV
AMTC22I 01AB 3490 OFFLINE                /REMOV
AMTC22I 01AC 3490 OFFLINE                /REMOV
AMTC22I 01AD 3490 OFFLINE                /REMOV
AMTC22I 01AE 3490 OFFLINE                /REMOV
AMTC22I 01AF 3490 OFFLINE                /REMOV
```

CONSOLES

The CONSOLES (CON) service displays the number of undisplayed messages per system console and the number of reply buffers in use. This service helps you determine which console in an MCS environment is not operational.

With this service, you can also determine the number of console reply buffers in use when diagnosing the cause of a wait state (for example, when a job that must issue a WTOR is waiting for reply buffers to be freed by other tasks in the system).

Syntax

►—CONSOLES —————►

Example

To list the number of messages to be displayed, type

```
consoles
          ①          ②
AMTC32I  CONSOLE 0A0 HAS    1 MESSAGES TO BE DISPLAYED
AMTC32I  CONSOLE 0A2 HAS 198 MESSAGES TO BE DISPLAYED
          ③
AMTC33I  198 OF 200 CONSOLE BUFFERS IN USE
          ④
AMTC34I  1 OF 006 REPLY BUFFERS IN USE
```

Legend:

1. Console address.
2. Number of messages to be displayed. A high number indicates a backlog of messages.
3. Total number of console buffers in use by the system. This number can be less than the sum of messages to be displayed at the various consoles because a message can be routed to more than one console.
4. Number of reply buffers in use.

CPU

The CPU service provides information about job activity by noting the proportionate use of CPU resources by job. Use CPU to monitor system activity.

Syntax

where

time Is the length of the sample period in seconds; the default is 10 seconds.

Example 1 (for PR/SM Systems)

To display information about CPU usage for the past 10 seconds, type

cpu

```
AMTOB1I PLEX BUSY          59.1% ①
AMTOB1I PLEX WAIT          37.2% ②
AMTOB1I PLEX OVERHEAD      3.7% ③
                                ④
AMTOB1I PARTITION RCVD.    34.1% WHICH IS
                                ⑤
AMTOB1I                    56.8% OF ITS RELATIVE SHARE
AMTOB0I
AMTOB3I                    USED  PRIORITY
                                ⑥    ⑦    ⑧    ⑨
AMTOB4I JOB GEN1CLS        16.4% A3 (163)
AMTOB4I STC AAOSSEB2       9.2% A4 (164)
AMTOB4I TSO CMR4X          5.2% FF (255)
AMTOB4I JOB PWW1JOB        2.9% A2 (162)
AMTOB4I STC JES2           2.3% EF (239)
AMTOB4I STC DC$PAS         2.0% FF (255)
AMTOB4I TSO LGS171         1.7% FF (255)
AMTOB4I STC *MASTER*       1.7% FF (255)
AMTOB4I TSO EUK2           1.7% FF (255)
```

AMTOB4I	STC	ITSTPAS	1.5%	A0 (160)
AMTOB4I	STC	CATALOG	1.4%	FF (255)
AMTOB4I	TSO	IXR2	1.1%	FF (255)
AMTOB4I	STC	MIMB	1.1%	FF (255)
			⑩	
AMTOB5I	ALL OTHERS	USED	8.6%	
			①	
AMTOB6I	TOTAL	USED	56.8%	
AMTOB0I				
AMTOB2I	BATCH=	34.2%, STC= 43.9%, TSO= 21.9%, TOTAL=100.0%		②

Legend:

1. Percentage of the sample period that the complex was performing useful work.
2. Percentage of the sample period that the processors were not dispatched to a partition because the partitions were waiting.
3. Percentage of the sample period used by the hardware to dispatch processors to partitions.
4. Percentage of the sample period that the partition hosting the SYSPROG Services session was dispatched. Subtracting this percentage from the PLEX BUSY percentage yields the percentage of the sample that all other partitions in the complex were dispatched.
5. Percentage of the partition's *relative share* (the amount of processing time that the partition is supposed to receive when the partition's demands are high and resources are limited) used during the sample period. When the partition can use more time and time is available, it can exceed 100 percent of its relative share. Likewise, the partition can (when wait assist is off) receive less than its relative share.
6. Type of address space: a batch job (JOB), started task (STC), or TSO session (TSO).
7. Names of the 15 highest usage address spaces in the system with CPU usage of at least 1%.
8. CPU usage by address space.
9. Priority of the address space.
10. CPU usage for all other address spaces in the system.

- ❶ Sum of CPU usage for all address spaces in the partition during the sample interval. This sum is equal to the partition's relative share usage (56.8 percent in this example).
- ❷ Usage distribution among batch jobs, started tasks, and TSO sessions.

Example 2 (for Non-PR/SM, Non-MDF Systems)

To display information about CPU usage for the past 10 seconds, type

cpu

```
AMTO15I  STATISTICS BEING GATHERED FOR CPU DATA ❶
AMTO14I  JOB INVENTORY USED      11.96 SECS,  48%,  PRTY 11  (162)
AMTO14I  JOB SMU1RLA USED        6.44 SECS,  26%,  PRTY  7  ( 84) ❷
AMTO11I  TOTAL FOR MVS O/HEAD    4.12 SECS,  21% ❸
AMTO12I  TOTAL FOR BATCH JOBS   10.01 SECS,  50% ❹
AMTO13I  TOTAL FOR TSO SESSIONS  5.87 SECS,  29% ❺
AMTO17I  CPU 0 WAS 66% BUSY ❻
```

Legend:

1. Message issued at the beginning of data collection.
2. Amount of time and percentage of CPU used by each of the 10 most active jobs in the system. Although only the 10 most active jobs are displayed, the total figures reflect all jobs.
3. Total OS/390 overhead not allocated to a specific address space.
4. Total time and percentage of CPU taken by batch jobs during the sample period. This includes both submitted jobs (JOB) and started tasks (STC).
5. Total time and percentage of CPU time taken by TSO sessions during the sample period.
6. Percentage of the CPU that was busy during the sample period. (This message is repeated for each CPU in a multiprocessor.)

Note: In an MP environment, the percentages could total more than 100 percent. Over the sample period, any CPU in an MP system could have been active 100 percent of the time, or a single job could have executed on each of the CPUs several times during the sample period.

Legend:

1. This line and the line above it represent the column labels.
 - *SP* stands for Sub Pool (first column).
 - *Key* describes the rest of the columns, which are key numbers.
 - The amount of storage for keys 8-15 is combined in one column.
 - Keys 0-7 each have their own column.
 - Above most numbers is a mnemonic describing the system component that allocates storage in that key.
2. One line per subpool. The subpool number appears first, followed by the amount of storage, if any, allocated in that key within the subpool.
3. The total amount of storage allocated with that key, and the sum allocated for all keys.

Example 2

To display an overview of CSA usage, type

csa					
AMTCM0I	-----CSA-----		-----ESCA-----		
AMTCM1I Size	3,816K		201M	①	
AMTCM2I Converted to SQA	0K	0.0%	0M	0.0%	②
AMTCM3I Allocated	814K	21.3%	36M	18.1%	③
AMTCMHI High-water mark	822K	21.6%	37M	18.4%	④
AMTCM4I Available	3,002K	78.7%	165M	81.9%	⑤
AMTCMFI Largest avail blk	2,908K	76.2%	161M	80.3%	
AMTCMZI					
AMTCM5I	-----SQA-----		-----ESQA-----		
AMTCM6I Size (Incl Conv)	1,816K		18M	①	
AMTCM7I Obtained from CSA	0K	0.0%	0M	0.0%	②
AMTCM8I Allocated	1,122K	61.8%	10M	56.0%	④
AMTCMHI High-water mark	1,238K	68.2%	11M	59.8%	③
AMTCM9I Available	694K	38.2%	8M	44.0%	⑤
AMTCMZI					

Legend:

1. Total amount of CSA/ESCA defined.
2. Amount of space converted to SQA/ESQA and percentage of total CSA/ESCA.

3. Total amount of space currently used and percentage of total CSA/ECSA.
4. The highest utilization level since the system was IPLed (z/OS and above only).
5. The total amount of storage available to be allocated.

Note: The output printed to AutoOPERATOR does not use commas in the numbers. Thus, 2,908K appears as 2908K.

CTCB

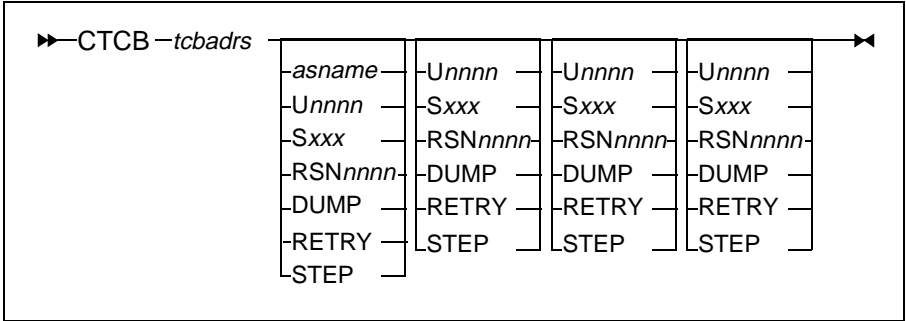

The CTCB service provides the ability to abnormally terminate any task in an address space. You can, optionally, specify

- the ABEND and reason code
- that a dump be taken
- that the task be allowed to retry

You can also indicate that the jobstep is to also be abnormally terminated if the task does not recover.

You can use the TCB service to display the tasks in an address space and create a symbolic name for each TCB.

Syntax

where

tcbadrs	Is a required parameter. You can specify a symbolic name that resolves to a TCB address in some address space (see examples) or the hexadecimal address of a TCB. If you specify a hexadecimal address, you must also specify the address space name as the second operand.
asname	Is optional if you enter a symbolic name in the first parameter position that also defines the address space; otherwise, it is required.
Unnnn	Is optional and can be entered in any parameter position except the first. The letters <i>nnnn</i> must be replaced with a four-digit decimal user ABEND code with a value of 1–4095. The task will be abnormally terminated with this code. The default code is U0086.

Sxxx	Is optional and can be entered in any parameter position except the first. The letters xxx must be replaced with a three hexadecimal character system code. The task will be abnormally terminated with this ABEND code. If you specify both Unnnn and Sxxx, the one entered last will take precedence.
RSNnnnn	Is an optional parameter and can be entered in any parameter position except the first. The letters nnnn must be replaced by one to nine decimal digits. The decimal value is used as the reason code.
DUMP	Is an optional parameter and indicates that a dump is requested. Note: A dump will not be produced unless SYSUDUMP, SYSABEND, or SYSMDUMP has been preallocated. A dump will not be produced if suppressed by a recovery routine established by the task being terminated. Your installation can also suppress dumps.
RETRY	Is an optional parameter and indicates that the task's recovery routines should be allowed to retry. Retry will not be allowed if RETRY is not specified.
STEP	Is an optional parameter. It indicates that the jobstep should also be terminated if the task fails to recover.

Example 1

After using the TCB service to display information for the TCBs in an address space, you decide that you want to abnormally terminate the TCB labeled @TCB004. You do not care what abnormal termination code is used, so you accept the default of U0086. You also do not want the task's recovery routine to be able to retry, you do not want a dump, and you do not want to terminate the jobstep task; you only need to specify the symbolic name for the TCB.

```
CTCB , @TCB004
```

Example 2

You want to cause an abnormal termination in a task to test the recovery routine. Therefore, you want to specify a specific ABEND code, and you want to allow the task to retry:

```
CTCB , @TCB004 , S0C4 , RETRY
```

Example 3

You want to abnormally terminate a task with a user ABEND code, and you also want to provide a reason code:

```
CTCB,@TCB004,U2000,RSN30
```

Example 4

You want to abnormally terminate a task. You know the TCB address, and you know that the ASID from the address space is decimal 31. You can also enter the ASID as a hexadecimal value (XIF):

```
CTCB,160FF8,(31)
```

DEALLOC

The DEALLOC (DEA) service

- deallocates devices allocated by service ALLOCATE
- deallocates devices erroneously allocated or those that remain allocated by a job that does not terminate properly

Syntax

where

<i>dvn</i>	Is the hexadecimal device number of the device.
ON	Causes the deallocated device to be marked online upon completion of the service DEALLOC.
OFF	Causes the deallocated device to be marked offline upon completion of the service DEALLOC.

Example

To deallocate device 180, type

```
DEA 180
```

```
AMTA21I    DEVICE 180 DEALLOCATED
```

Usage Note

- The deallocated devices are online upon completion of service DEALLOC unless you specify OFF, in which case the device is deallocated and marked offline. Specifying OFF does not cause the automatic unloading of a device.
- In a shared tape environment, DEALLOC followed by VARY OFFLINE unloads a device that can be in use on another system.
- The DEALLOC service only resets bits in the UCB. No measures are taken to avoid adverse effects on active tasks using the UCB.

DEVIATN

The DEVIATN (DEV) service displays deviation from a list of jobs that must be active during specified time intervals and notifies you when a job that should be active is not. This list of jobs resides in a CONFIG xx member of SYS1.PARMLIB.

Syntax

where

00	Is the default suffix of the CONFIG xx member.
xx	Is the suffix of the CONFIG xx member in SYS1.PARMLIB that is to be used.

The entries in the CONFIG xx member must begin in column 1. The format of the entries is

**/NAME=jobname TIME=hhmm-hhmm ACT=command*

where

<i>jobname</i>	Is the jobname (or started task ID for started tasks).
<i>hhmm-hhmm</i>	Are the beginning and ending times for the interval in which the specified job must be active. <ul style="list-style-type: none"> Valid values for <i>hh</i> are 00 to 23. Valid values for <i>mm</i> are 00 to 59.
<i>command</i>	Is an optional field that you can substitute with any OS/390 command. The command executes if the targeted job is not active during the specified time interval. ACT is ignored when the service is not invoked asynchronously. When ACT is specified, <i>command</i> cannot be blank.

Example

Assume that warning messages are to be issued if job INVENTORY is not active between 8:00 A.M. and 5:00 P.M. Place the following entry in the CONFIG00 member of SYS1.PARMLIB:

```
*/NAME=INVENTORY TIME=0800-1700
```

To display deviation from the CONFIG00 member, type

```
deviatn 00
```

```
AMTCF6I NO DEVIATION FOUND FROM CONFIG00
```

If job INVENTORY is not active during the time specified in the CONFIG00 member, a warning message is displayed, as illustrated here:

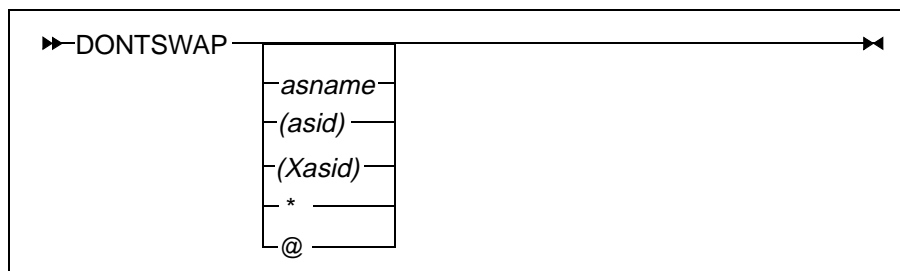

```
deviatn 00
```

```
AMTCF8I WARNING INVENTORY SHOULD BE ACTIVE 0800-1700
```

DONTSWAP

The DONTSWAP (DON) service makes an address space nonswappable.

Syntax

where

<i>asname</i>	Is the address space name.
<i>(asid)</i>	Is the address space identifier in decimal format.
<i>(Xasid)</i>	Is the address space identifier in hexadecimal format.
*	Specifies the last address space entered.
@	Specifies your own address space.

Note: If you do not specify an address space to be made nonswappable, you are prompted to define an address space.

Example

To make address space INVENTORY nonswappable, type

```
dontswap inventory
      ①                ②                ③
AMTS51I  JOB0205 INVENTORY STEP1  PRTY EF (239)  PGP 2/5
                        ④
AMTS52I  INVENTORY HAS BEEN SET NONSWAPPABLE (01)
```

Legend:

1. JES job ID, name, and current step name of the specified address space.
2. External and internal dispatching priority of the address space; the dispatching priority is higher than it was before the DONTSWAP service was issued (however, the condition is temporary and the priority returns to its previous level).
3. Performance group and performance group period.
4. Nonswappability count; the operating system keeps this count for the address space. (If the count is greater than zero, the address space is still nonswappable; when the count reaches zero, the address space is swappable.)

DSNAME

The DSNAME (DSN) service displays information about a specified data set, including

- volume serial number
- device type
- tracks allocated
- tracks used
- number of extents
- data set organization
- record format
- block size
- logical record length

Syntax

»—DSNAME —*dsname* —————«

where

dsname Is the data set name.

Examples

To display information about data set SYS1.DUMP05, type

dsname sys1.dump05

```
AMTD10I DATASET SYS1.DUMP05 ①
AMTD13I VOL=DUMPB1; DEVT=3380;      TRACKS ALLOCATED= 2175, USED=    920 ②
AMTD1EI EXTENTS= 1; ③
AMTD14I DSORG=PS;    RECFM=FB;      BLKSIZE= 4160;                      LRECL= 4160 ④
```

To display the volume serial numbers of data set MASTER.TAPE, type

```
dsname master.tape
```

```
AMTD10I    DATASET MASTER.TAPE
AMTD11I    VOLUMES 874008  316002  000381 ⑤
```

Legend:

1. Name of the specified data set.
2. Volume and device type on which the data set resides, as well as the space allocated and used.
3. Number of extents used.
4. RECFM/LRECL/BLKSIZE and organization of the data set.
5. Only volume information is displayed for data sets residing on tape or for a disk data set residing on a volume that is not currently mounted.

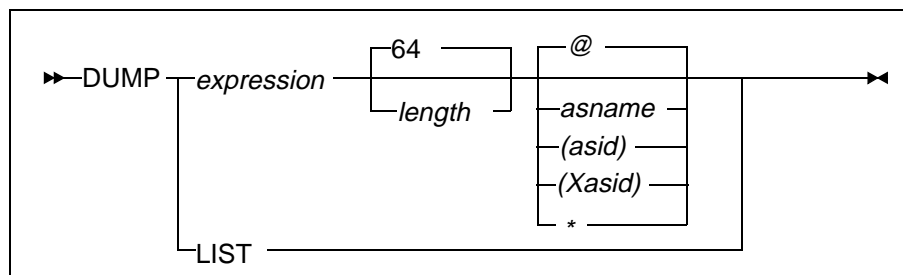

Usage Notes

- Only the volume serial number and data set organization are provided for VSAM data sets.
- For data sets on multiple mounted volumes, the usage data is displayed for each volume.
- A maximum of 20 volume serial numbers can be displayed per command.

DUMP

The DUMP (DU or LI) service displays the contents of storage in hexadecimal and character formats.

Syntax

where

expression

Specifies the location in memory that you want to display. The expression parameter has two parts: a memory location and, optionally, any combination of offsets (+ or - hex values) or indirection indicators (% , ? , or >).

- The memory location can be a hex address, a predefined symbolic name, or an asterisk.
 - The hex address can be from one to eight hex digits.
- Symbols are defined with the EQUATE service; see "EQUATE" on page 4-70 for more information.

An asterisk represents the start of the area last displayed or the start of a load module located by the LPA service.

When specified, an offset is a one- to four-digit hex value preceded by a plus or minus sign. This value indicates the relative distance from the beginning of the location defined by the first part of *expression* to the area in storage to be displayed.

An indirection indicator specifies that the address contained in the full word at the location defined by the first part of *expression* becomes the address to be used next. You can use the following indirection indicators:

- % Indicates that the address contained in the word located by the first part of *expression* is treated as a 24-bit address and that this address replaces the first part of *expression* before continuing.
- ? Indicates that the address contained in the word located by the first part of *expression* is treated as a 31-bit address and that this address replaces the first part of *expression* before continuing.

- > Indicates that the address contained in the three bytes located by the first part of *expression* is treated as an SWA address token, and that the value of this token replaces the first part of *expression* before continuing.

<i>length</i>	Is the length, in bytes, of the storage area to be dumped. The default length is 64.
@	Specifies your own address space; the default.
<i>asname</i>	Is the address space containing the storage to be displayed.
(<i>asid</i>)	Is the address space identifier in decimal format.
(<i>Xasid</i>)	Is the address space identifier in hexadecimal format.
*	When specified as an address space name, indicates the last address space entered.
LIST	Displays the predefined and user-defined symbols, along with their respective definitions, that can be used with DUMP. (See "EQUATE" on page 4-70 for information on defining symbols.)

Examples

To display the beginning of the CVT, type either one of the following.

Example 1

```

du,10?
      ①      ②      ③      ④
AMTC12I 00FCF478 00 00000218 00FDFCD0 00FD2F94 00FCFA60 *.m...- *
AMTC12I 00FCF488      00000000 00FDDE9C 00FF65FE 00FE0F00 *. *
AMTC12I 00FCF498      00FE0D32 0169CB70 810A46B0 00FE4F98 *.a...q *
AMTC12I 00FCF4A8      00F1CFC0 00FE0138 0102058F 00FCFA88 *.l...h *
AMT001A SYSPROG

```

Example 2

```

du,@CVT,64
      ①      ②      ③      ④
AMTC12I 00FCF478 00 00000218 00FDFCD0 00FD2F94 00FCFA60 *.m...- *
AMTC12I 00FCF488      00000000 00FDDE9C 00FF65FE 00FE0F00 *. *
AMTC12I 00FCF498      00FE0D32 0169CB70 810A46B0 00FE4F98 *.a...q *
AMTC12I 00FCF4A8      00F1CFC0 00FE0138 0102058F 00FCFA88 *.l...h *

```

Legend:

1. Display address.
2. Virtual storage key (first digit) and fetch-protect bit (high order bit of second digit); the remaining three bits are always zero.
3. Sixteen-byte hexadecimal dump per line.
4. Character representation of hexadecimal dump.

Example 3

When you type **DUMP** without any operands, you see a list of all of the user-created symbols (by way of the EQUATE service) or the symbols created on behalf of the user (by the MEMSCAN and TCB services).

dump

```
AMTC1HI USER DEFINED SYMBOLS ARE:
AMTC1GI @TCB001    7FD968
AMTC1GI @TCB001    7CAD90
AMTC1GI @TCB003    7CA930
AMTC1FI @TCB004    7BCE88
AMTC1GI @TCB005    7CA5F0
AMTC1GI @TCB006    7EE6B0
AMTC1GI @TCB007    7EEA40
AMTC1G1 @TCB008    7EE468
AMTC1GI @TCB009    7EE150
```

To display the symbols that can be used with the DUMP service, type

dump list

```
AMTC1HI USER DEFINED DUMP SERVICE LABELS ARE:
AMTC1GI @PWVT      00008C88
AMTC1GI @AVT       00009000
AMTC1GI @BBCT      @AVT+58?
AMTC1FI PREDEFINED DUMP SERVICE CONTROL BLOCK LABELS ARE:
AMTC1GI @ACB       10%+100?+14?+18?
AMTC1GI @AMCBS     10%+100?
AMTC1GI @ASCB      224%
AMTC1G1 @ASMVT     10%+2C0?
AMTC1G1 @JSTCB     224%+6C%+8%+7C%
```

Example 4

You can use a combination of predefined symbols and indirection indicators to display the CDEs for the job pack area (JPA) for an address space. For example, to locate the beginning of the chain and display the first CDE for address space JES2, type

```
dump @jstcb+2c? 32 jes2
```

```
AMTC12I 007E2000 00 007E2040 00000000 C9C5C6C3 D5C1D4E2 *... ..IEFCNAMS*
AMTC12I 007E2010      800F2340 007E20E8 000210FC 31224000 *... ..Y..... .*
```

The +2c? in the command displays the 31-bit address located at +2C from the beginning of the area.

To display the next CDE in the chain, type

```
dump **? 32 *
```

```
AMTC12I 007E2040 00 007FD580 00000000 C9C5C6E5 C8F14040 *..N.....IEFVH1  *
AMTC12I 007E2050      863755C0 007FF060 000210FC 31224000 *.....0-..... .*
```

The first asterisk in the command represents the beginning of the area previously displayed, and the second asterisk indicates that the target address space is the same as in the previous command.

To display the next CDE in the chain, simply repeat the previous command:

```
dump **? 32 *
```

```
AMTC12I 007FD580 00 007FD5C0 00000000 C9C5C1E5 D4F7F0F3 *..N.....IEAVM703*
AMTC12I 007FD590      86217D88 007FD5E0 000110FC 31224000 *.....N..... .*
```

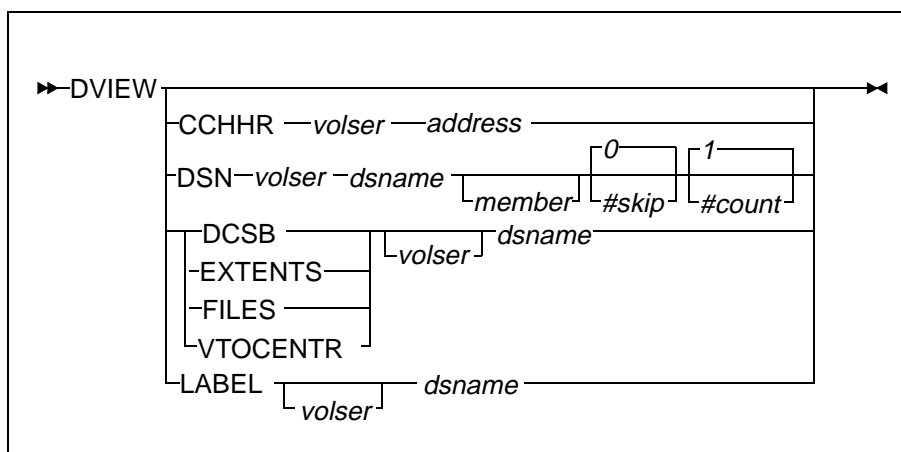

You can repeat this command until all CDEs in the chain have been displayed.

Usage Notes

- The DUMP service operates in SRB mode when displaying data. Therefore, PSATOLD (task control block -TCB old pointer of the prefixed saved area) always contains zero and cannot be used to locate the current TCB (task control block).
- ZAP is sometimes used immediately following DUMP. The beginning address of the storage area last displayed by DUMP is retained. The ZAP service can refer to this address by using an asterisk (*) for the *hex* location parameter.
- For processor complexes consisting of more than one CPU, you can specify a CPU number. Add /*c* to the end of the value specified for *expression*, where *c* is the number of an available CPU.
- LIST or LI is a valid alias for the DUMP service.
- If you omit the *length* parameter on the **COMMAND** line, you can specify the *asname* parameter in its place; for example, DUMP @CSCB INVENTORY, where INVENTORY is an address space name.

- extents of a data set
- DSCB of a data set
- list of data sets on the volume
- a volume's VTOC
- a volume's label

Syntax

CCHHR	Displays a data block using its cylinder, track, and record number.
<i>volser</i>	Specifies the volume serial number of the DASD volume from which the data block is displayed. If this field is null, <i>volser</i> is obtained from the catalog.
<i>address</i>	Is a required field that specifies the cylinder, head, and record of the data block to be displayed; the format of the operand is a 10-digit hex value, <i>cccchhhrrr</i> .
DSN	Displays the data blocks requested from a specified data set or member.

<i>dsname</i>	Is a required field that specifies the data set name to be displayed; use the special name *FMT4 to specify the VTOC. Note: Enclose *FMT4 in single quotation marks (*FMT4') when specifying this field from the SYSPROG Services selection panel.
<i>member</i>	Is an optional part of the dsname that specifies the member of a partitioned data set from which the data blocks are displayed.
<i>#skip</i>	Is an optional field that specifies the number of data blocks to be skipped; the default value is zero (an EOF block does not stop the operation and is counted as a block).
<i>#count</i>	Is an optional field that specifies the number of data blocks to be displayed; the default value is one (an EOF block stops the operation).
DSCB	Displays the Format 1 DSCB of a specified data set.
EXTENTS	Displays an extent list for the specified data set.
FILES	Lists the file names in the VTOC that begin with a partial data set name.
VTOCENTRY	Displays the VTOC entry for the specified data set.
LABEL	Displays the label data block of a volume.
Note: You can abbreviate the first operand to an unambiguous character. For example, you can abbreviate CCHHR to C because no other operands in the DVIEW syntax diagram begin with that letter. However, you cannot abbreviate DSCB to D or even DS because these abbreviations conflict with the DSN operand; instead, abbreviate DSCB to DSC.	

Examples

The following examples illustrate ways to invoke the DVIEW service.

CCHHR Example

To display the data block found on volume PMG005 at cylinder 40, track 13, record 26, type

```
dview cchhr pmg005 0028000d1a
```

```
AMTVD08I
```

```

EDTINFO

The EDTINFO service provides information about unit names in the current Eligible Device Table (EDT). Unit names are subdivided into *generic* and *esoteric*. Generic names are IBM device type names such as 3380, 3390, or 3400-6. Esoteric names are user defined; for example, SYSDA, TAPE, and CART.

Syntax

where

<i>=class name</i>	Displays a list of the generic and esoteric unit names for the specified class name. You must prefix the class name with an equal (=) sign. The default is =DASD. Supported class names are DASD, TAPE, UREC, COMM, CTC, CHAR, and DISP.
<i>unitname</i>	Displays the device number, device type, volser, and the use status of the specified unit name.
ONLINE	Limits the display to online devices; the default.
OFFLINE	Limits the display to offline devices.
ALL	Displays information for all devices.
STORAGE	For DASD devices, limits the display to devices containing volumes with a use attribute of STORAGE. This parameter is ignored for other device types.
PUBLIC	For DASD devices, limits the display to devices containing volumes with a use attribute of PUBLIC. This parameter is ignored for other device types.
PRIVATE	For DASD devices, limits the display to devices containing volumes with a use attribute of PRIVATE. This parameter is ignored for other device types.

Examples

To display the generic and esoteric unitnames for device class DASD, type

edtinfo

```

AMTED1I          DEVICE          ①
AMTED2I UNITNAME  COUNT  FOR CLASS=DASD
          ②
AMTED3I 2305-2      1
AMTED3I 3390        144
AMTED3I 3330        1
AMTED3I ALLDA      608
AMTED3I SYSTSO     384          ③
AMTED3I SYSVIO      1  VIO ELIGIBLE
AMTED3I TSGDA      16
AMTED3I VIO         1  VIO ELIGIBLE
AMTED3I VIO3390     1  VIO ELIGIBLE
AMTED3I SYSALLDA   660

```

Legend:

1. Device class being displayed.
2. Number of devices defined for the respective generic or esoteric unit name.
3. Indicates that the unitname is VIO eligible.

To display information about the online devices for the esoteric unit name CART, type

edtinfo cart

```

          ①          ②
AMTED4I 16 DEVICES FOR ESOTERIC UNITNAME CART. DISPLAYING ONLINE ONLY.
          ③ ④ ⑤
AMTED5I DVN DEV TYPE VOLSER  STATUS
AMTED6I 480 3480      CC7273
AMTED6I 488 3480      501697
AMTED6I 489 3480      508881

```

Legend:

1. Indicates that the unit name is esoteric.
2. Indicates that only online devices are displayed.
3. Device number.
4. Device type. (A unit name can contain devices with different device types.)

5. Device volume serial number. VOLSER is applicable only to DASD and TAPE devices.

To display information about all the devices for the generic unit name 3400-6, type

edtinfo 3400-6 all

AMTED4I 31 DEVICES FOR GENERIC UNITNAME 3400-6. DISPLAYING ALL. ①
②
AMTED5I DVN DEV TYPE VOLSER STATUS
AMTED6I 180 3400-6 OFFLINE
AMTED6I 181 3400-6 OFFLINE
AMTED6I 182 3400-6 OFFLINE
AMTED6I 183 3400-6 ONLINE
AMTED6I 184 3400-6 OFFLINE
AMTED6I 185 3400-6 OFFLINE

Legend:

1. Indicates that both online and offline devices are displayed.
2. Use status of the device.

To display the total number of generic unitname 3390, type

edtinfo, 3390

AMTED4I 160 DEVICES for Generic unitname 3390. Displaying online only. ①
②
AMTED5I DVN Dev Type VOLSER Status
AMTED6I 2A0 3390 HSM301 Private
AMTED6I 2A2 3390 SYSS1C Private
AMTED6I 2A3 3390 ES522D Private
AMTED6I 2A4 3390 STRA03 Storage
AMTED6I 2A7 3390 SP52EM Private

Legend:

1. Indicates that only online devices are displayed.
2. Use attributes and status of the device.

To display only those devices with the generic name 3390 that are in storage status, type

edtinfo, 3390, storage

```
AMTED4I    160 Devices for Generic  unitname 3390. Storage only. ①
                                     ②
AMTED5I    DVN Dev Type VOLSER  Status
AMTED6I    2A4 3390      STRA03  Storage
AMTED6I    323 3390      FAT902  Storage
AMTED6I    2A5 3390      STRBC1  Storage
AMTED6I    309 3390      BAB318  Storage
AMTED6I    320 3390      FAT900  Storage
AMTED6I    322 3390      FAT901  Storage
AMTED6I    D27 3390      TSG306  Storage
AMTED6I    D2A 3390      TSG311  Storage
AMTED6I    D31 3390      EMP301  Storage
```

Legend:

1. Indicates that only storage devices are displayed.
2. Use attributes and status of the device.

Usage Notes

- The class name can be abbreviated to the shortest unique value; for example:
 =T or =TA (for TAPE)
 =U or =UR (for UREC)
- Unlike class names, unit names cannot be abbreviated.
- Devices can be (and often are) included in multiple unit names.
- For DASD devices, one of these use statuses is displayed:
 - PRIVATE
 - PUBLIC
 - STORAGE

ENQUEUES

The ENQUEUES (ENQ) service displays current enqueue conflicts or requested system enqueue information. An enqueue conflict exists when one or more jobs are waiting on a resource held by another job. This service helps you determine the cause of reduced system performance, the name and system ID for jobs holding a resource, and the jobs waiting for the same resource.

When you type the ENQUEUES command without operands, information about any current enqueue conflicts is displayed. The ENQUEUES service also displays enqueue information for a specified minor name and major name (R name and Q name, respectively), or all enqueue information for a specified major name (Q name). The default major name is SYSDSN. Therefore, you can display enqueues for a data set simply by typing the data set name (minor name).

Syntax

where

<i>minor name</i>	Is the R name used by ENQUEUE.
<i>minor name*</i>	Indicates a partial minor name. Partial names can be specified using a wildcard character (asterisk).
<i>major name</i>	Is the Q name used by ENQUEUE; SYSDSN is the default.
<i>dsname</i>	Is a data set name.
<i>member</i>	Is a member name.
SPFEDIT	Is the major name used by ISPF EDIT.

Examples

The following examples demonstrate how the ENQUEUEES service presents information on enqueue conflicts and resource ownership.

Conflict Information Example

An enqueue conflict exists when one or more jobs wait for a resource held by another job. The ENQUEUEES service displays the name and system ID of jobs holding a resource and the jobs waiting for the same resource. Use this information to determine the source of the performance delay in your system.

To display all current enqueue conflicts, type

enqueuees											
	①	②	③	④							
AMTQ1PI	SYSTEM	(LOCAL)	Q=SYSZVVDS R=CATALOG.ICFMCAT.SYSC								
AMTQ1QI	SYSID	JOBNAME	ASID	STAT	TYP	TIME	14:12:19				
AMTQ1RI	SYSB	QA7A	(0087)	OWNS	EXC						
AMTQ1RI	SYSA	FLN1	(0096)	WAIT	EXC						
AMTQ1RI	SYSB	QA7	(0352)	WAIT	EXC						
AMTQ1LI											
AMTQ1PI	SYSTEM	(LOCAL)	Q=SYSIGGV2 R=ICFUCAT.VTSG304								
AMTQ1QI	SYSID	JOBNAME	ASID	STAT	TYP	TIME	14:12:19				
	⑤	⑥	⑦	⑧	⑨						
AMTQ1RI	SYSB	ARG1	(0162)	WAIT	EXC						
						⑩	①	②	③	④	
AMTQ1RI	SYSC	MPP1	(0121)	OWNS	SHR	RES=003	PEND	291	TSG304	NR	

Legend:

1. Scope of enqueue. The possible scopes are as follows:
 - SYSTEMS
 - SYSTEM
 - STEP
2. Whether the resource is global or local.
3. Major name (Q=).
4. Minor name (R=).
5. System ID for the system executing the task that is holding or waiting for the resource.

6. Jobname, TSO user ID, or started task ID for the address space containing the task that is holding or waiting for the resource. The jobname is not available in some situations.
 7. ID for the address space holding or waiting for the resource.
 8. Current status (OWNS or WAIT), indicating that the task holds (OWNS) the resource or is waiting (WAIT) for the resource.
 9. Type of enqueue: EXC for exclusive, SHR for shared.
 10. Indicates that a reserve is associated with the enqueue. The reserve count is also displayed unless it is zero, in which case the equal sign is also omitted. CVT is displayed instead of RES if the reserve has been converted to a global enqueue.
- ❶ If present, indicates that the reserve is pending, which means that the task is waiting to reserve the devices. Generally, the device is reserved by another system.
 - ❷ Device number in hexadecimal.
 - ❸ Volume serial number.
 - ❹ If present, indicates that the device is not ready.

Resource Ownership Information Examples

Typing ENQUEUES followed by the minor name (R name) and major name (Q name) displays the jobs that hold the specified resource and information related to their use of the resource. A partial minor name displays all enqueues with minor names that begin with the specified characters for the requested major name. An asterisk typed as the last character indicates a partial minor name. SYSDSN is the default major name.

To display all enqueues for data sets starting with SYS1.L, type

```
enqueues sys1.l*
```

```
AMTQ1P1 SYSTEM (LOCAL) Q=SYSDSN R=SYS1.LPALIB
AMTQ1QI SYSID JOBNAME ASID STAT TYP TIME 16:05:20
AMTQ1RI SYSB MEE2 (0192) OWNS SHR
AMTQ1LI
AMTQ1P1 SYSTEM (LOCAL) Q=SYSDSN R=SYS1.LINKLIB
AMTQ1QI SYSID JOBNAME ASID STAT TYP TIME 14:12:19
AMTQ1RI SYSB LLA (0006) OWNS SHR
```

Besides SYSDSN, another common major name is SPFEDIT. ISPF EDIT uses the major name SPFEDIT and a 52-character minor name consisting of the data set name (a 44-character field padded with blanks), followed by the member name.

The ENQUEUES service provides special syntax to allow you to display these ISPF EDIT enqueues for specific members. Type the data set name (dsn), followed by a slash (/), followed by the member name, a comma (or blank), and the major name SPFEDIT.

For example, to determine the jobnames editing member IEASYS00 in SYS1.PARMLIB, type

```
enqueues sys1.parmlib/ieasys00,spfedit
```

```
AMTQ1P1 SYSTEM (LOCAL) Q=SPFEDIT R=SYS1.PARMLIB IEASYS00
AMTQ1QI SYSID JOBNAME ASID STAT TYP TIME 14:12:19
AMTQ1RI SYSB CIR3 (0183) OWNS EXC
```

In each of these examples, the header line is followed by two or more information lines. The ENQUEUES service displays one line for each task that issued an ENQ or RESERVE for the resource.

To display all jobs using all resources for a major name, type an asterisk (or a comma to indicate no minor name), followed by the major name, as illustrated here:

```
enqueues *,syszvuds
```

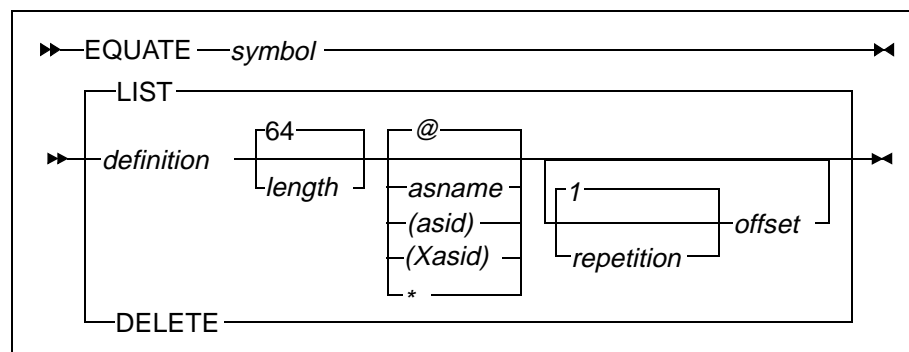

```
AMTQ1P1 SYSTEM (LOCAL) Q=SYSZVUDS R=CATALOG.ICFMCAT.SYSC
AMTQ1QI SYSID JOBNAME ASID STAT TYP TIME 14:12:19
AMTQ1RI SYSB QA7A (0087) OWNS EXC
AMTQ1RI SYSB FLN1 (0096) WAIT EXC
AMTQ1RI SYSD QA7 (0352) WAIT EXC
```

Note: Specifying a partial minor name can produce a large volume of output.

EQUATE

The EQUATE (EQ) service assigns a symbolic name to an address expression. The DUMP service permits symbols to be used in place of address expressions. With EQUATE, you can define, redefine, and display symbol definitions.

Syntax

where

<i>symbol</i>	Is the symbol to be defined or displayed. The symbol must begin with @ and can be followed by one to eight alphanumeric characters.
LIST	Displays the definition of the symbol, if previously defined; the default.
<i>definition</i>	Is an expression that defines the symbol. This expression can begin with either a previously defined symbol (including the one being defined) or a hexadecimal address, optionally followed by offset values (+ or -) or indirection indicators (% or ?) or both. For example, the start of the CVT prefix can be defined as 10%-100.
<i>length</i>	Specifies a length between 1 and 4096 bytes that is associated with the symbol; the default length is 64.
@	Specifies your own address space; the default.
<i>asname</i>	Specifies the address space name associated with the symbol.
<i>(asid)</i>	Is the address space identifier in decimal format.
<i>(Xasid)</i>	Is the address space identifier in hexadecimal format.
*	Specifies the last address space typed.

<i>repetition</i>	Specifies the number of control blocks, between 1 and 99, that are displayed; the default is 1. When this parameter is present, the DUMP service assumes that the symbol describes a chain of control blocks to be followed until the end of the chain is reached or the repetition count is exhausted. The pointer to the next control block is defined by the <i>offset</i> parameter. Note: When you specify the <i>repetition</i> parameter, you must also specify the <i>offset</i> parameter.
<i>offset</i>	Is a 1- to 4-digit hexadecimal value preceded by a plus (+) or minus (-) sign indicating the relative location of the pointer that contains the address of the next storage area displayed. The pointer must be a full word. A pointer value of 0 terminates the display. Prefixing <i>offset</i> with a percent symbol (%) indicates that the pointer is a 24-bit address; prefixing <i>offset</i> with a question mark (?) indicates that the pointer is a 31-bit address. The default is a 31-bit address.
DELETE	Deletes the symbol.

Examples

To display the definition of symbol @JSCB, type

```
equate @jscb
```

```
AMTEQ7I @JSCB=224%+6C%+8%+7C%+B4%,380
```

To define symbol @A as symbol @JSCB + DC? and give it a length of 64 bytes, type

```
equate @a @jscb+DC? 64
```

```
AMTEQ9I SYMBOL DEFINED
```

To delete symbol @A, type

```
equate @a delete
```

```
AMTEQ4I @A          DELETED
```

ESCLASS

The ESCLASS (ESC) service provides the ability to

- display a list of all current service classes
- display a specific service class
- change a service class
- quiesce an address space
- resume a job that has been quiesced

Syntax

where

<i>jobname</i>	Is the job name.
<i>(asid)</i>	Is the address space identifier in decimal format.
<i>(Xasid)</i>	Is the address space identifier in hexadecimal format.
<i>*</i>	Specifies the last address space entered.
<i>@</i>	Specifies your own address space.
<i>newclass</i>	Is the new service class name to be applied to the address space.
QUIESCE	Indicates that the address space is to be quiesced.
RESUME	Indicates that the service class for the specified address space is to be set according to the current service policy.

Examples

The following examples illustrate the uses of ESCLASS.

Example 1

To display a list of all service classes in the current service policy, type

esc

```

AMTES4I Policy name:  BBPOL002

Example 2

To display the service class and related service information for a specific address space, type

esc,xtsthpas

AMTES1I	Job name:	XTSTHPAS
AMTES1I	Service class:	STCPAS
AMTES1I	Description:	PAS STC's
AMTES1I	Resource group:	PASSTC
AMTES1I	Current period:	1
AMTES2I	Importance lvl:	3
AMTES2I	Period type:	Velocity goal
AMTES2I	Goal:	60%

Example 3

To change the service class for a specified address space and display the information, type

esc,xtsthpas,stcnrm

AMTES3I	Service class changed for address space XTSTHPAS	
AMTES0I		
AMTES1I	Job name:	XTSTHPAS
AMTES1I	Service class:	STCNRM
AMTES1I	Description:	Normal STC's
AMTES1I	Current period:	1
AMTES2I	Importance lvl:	4
AMTES2I	Period type:	Velocity goal
AMTES2I	Goal:	30%

Example 4

To quiesce a specified address, type

```
esc,xtsthpas,q
```

```
AMTES9I Address space XTSTHPAS has been quiesced.
```

Example 5

To resume (restart) a specified address space and display the information, type

```
esc,xtsthpas,resume
```

```
AMTES8I Resume successful for address space XTSTHPAS
AMTES0I
AMTES1I Job name:           XTSTHPAS
AMTES1I Service class:     STCPAS
AMTES1I Description:       PAS STC's
AMTES1I Resource group:    PASSTC
AMTES1I Current period:    1
AMTES2I Importance lvl:    3
AMTES2I Period type:       Velocity goal
AMTES2I Goal:              60%
```

Usage Notes

The following points detail what the ESCLASS service can do.

- Display a list of all service classes in the current service policy and their descriptions.

This display is produced when the ESCLASS service is executed without any operands.

- Display the service class for a specific address space and service-related information.

This display is produced when a jobname or ASID is specified as the first and only parameter. The ASID must be enclosed in parentheses and is assumed to be a decimal value unless preceded by an *x*.

Example: (x24) = (36)

- Change the service class for an address space.

This action is taken when a valid jobname (or ASID) is specified as the first parameter and a valid service class is specified as the second parameter.

Example: ESCLASS,(x24),newclass will change the service class for the job in the address space with an ASID of decimal 36 (hex 24) to newclass.

- Quiesce an address space by specifying a valid jobname or ASID as the first parameter and Q or QUIESCE as the second parameter.

Example: ESCLASS job1,Q will quiesce job1.

- Resume (restart) a job that has been quiesced and cause the service class to be set according to the current service policy.

Specify the name of a job or an ASID as the first parameter and the keyword RESUME as the second parameter.

Note: Resuming a job causes the appropriate service class in the current service policy to be applied to the specified job. If you are resetting the job to reverse a QUIESCE, check the service class that is displayed to ensure that it is the desired service class. If not, use the ESCLASS service to change the service class. An example of resuming an address space:

ESCLASS,job1,RESUME

ESTORAGE

The ESTORAGE (ES) service provides information on the use of expanded storage for paging. This service lets system programmers verify that expanded storage (sometimes referred to as extended storage) is being used effectively.

Syntax

where

MAP	Provides a detailed display of the expanded storage frames in use by each pageable job in the system.
<i>time</i>	Specifies the length in seconds of the sample period; the default sample period is five seconds.

Examples

To display information about expanded storage, type

estorage

```

AMTR30I STATISTICS BEING GATHERED FOR EXPANDED STORAGE DATA
AMTR31I ESF INSTALLED/ONLINE    1024/   1024           ①
AMTR32I AVAILABLE ESF                768           ②
AMTR33I REAL STORAGE MOVEMENT TO ES  20.00 PAGES/SEC  ③
AMTR34I ES MIGRATION TO AUX STORAGE  18.00 PAGES/SEC  ④
AMTR35I AVERAGE MIGRATION AGE         40 SEC         ⑤

```

Legend:

1. Number of expanded storage frames installed and number currently online.
2. Number of expanded storage frames currently available for use.
3. Rate of movement of pages from real storage to expanded storage.

4. Rate of movement of pages from expanded storage to auxiliary storage.
5. Average length of time that a page resides in expanded storage before being migrated to auxiliary storage.

To display additional information about expanded storage frames, type

estorage map

```
AMTR30I STATISTICS BEING GATHERED FOR EXPANDED STORAGE DATA
AMTR31I ESF INSTALLED/ONLINE    1024/   1024
AMTR32I AVAILABLE ESF                768
AMTR33I REAL STORAGE MOVEMENT TO ES  20.00 PAGES/SEC
AMTR34I ES MIGRATION TO AUX STORAGE  18.00 PAGES/SEC
AMTR35I AVERAGE MIGRATION AGE           40 SEC

      ①          ②          ③
AMTR36I  JOBNAME    ASID      ESF
AMTR37I  INVENTORY   0017     0038
AMTR37I  TESTJOB1    0023     0062
```

Legend:

1. A line is displayed for each address space that owns expanded storage frames.
2. Address space ID for each job.
3. Number of expanded storage frames currently owned by each job.

EXECUTE

The EXECUTE (EXE) service executes a list of SYSPROG Services, OS/390, or JES commands listed in a member within the specified data set. This service lets you invoke standard sequences of commands. Each SYSPROG Services command in the data set must be prefixed with @ (for example, @ENQ, @REPLIES) to distinguish it from OS/390 or JES commands.

Syntax

where

<i>membername</i>	Is a member within the specified or default data set.
<i>dsname</i>	<p>Is the specified data set name.</p> <ul style="list-style-type: none"> • If you do not specify a data set name, EXECUTE will use the previously specified data set. • If there is no previously specified data set, EXECUTE will use the data set allocated to DDNAME BBPARM. • If there is no data set allocated to DDNAME BBPARM, EXECUTE will use the data set allocated to DDNAME LIB. • If there is no data set allocated to DDNAME LIB, MAINVIEW for OS/390 will display an error message.

Example

To execute the commands listed in BBPARM library member SHIFT1, type

exe,shift1

```
AMTK11I V 01A0,OFFLINE          ①
AMTC22I IEE303I 01A0          OFFLINE  ②
AMTK10I
AMTK11I V 01A1,OFFLINE          ①
AMTC22I IEE202I 01A1          OFFLINE  ②
AMTK10I
AMTK11I V 01A2,OFFLINE          ①
AMTC22I IEE303I 01A2          OFFLINE  ②
AMTK10I
AMTK11I V 01A3,OFFLINE          ①
AMTC22I IEE303I 01A3          OFFLINE  ②
AMTK10I
```

Legend:

1. Command read from the BBPARM member SHIFT1.
2. Results of the command.

In the following example, the EXECUTE service is used to execute three services contained in member STATUS in the data set VAM3.RES.LIB. The services are preceded by the @ symbol, indicating that they are MAINVIEW for OS/390 services. The services are executed sequentially, with the results displayed after each service name.

To execute the contents of the member STATUS in the data set VAM3.RES.LIB, type

exe,status,vam3.res.lib

```
AMTK11I @RES ①
AMTQ2PI SYSTEMS (GLOBAL) Q=SYSIGGV2 R=ICFMCAT.SYSB ②
AMTQ2QI SYSID    JOBNAME  ASID  STAT TYP TIME   9:11:08
AMTQ2RI SYSB     CATALOG (0023) OWNS SHR CVT
AMTK10I
AMTK11I @ENQ ①
AMTQ15I NO ENQ CONFLICTS EXIST ②
AMTK10I
AMTK11I @IO ①
AMTI11I +*MASTER* Unit  227 PAGD27 IOQ 00FA4E00 Driver-ASM CCHH- 157 3 ②
AMTI11I XCFAS      Unit  800          IOQ 00FA4C00 Driver-*UNKNOWN
AMTI11I +XCFAS     Unit  801          IOQ 00FC1100 Driver-*UNKNOWN
```

AMTI11I	XCFAS	Unit	804	IOQ	00FA4900	Driver-*	UNKNOWN
AMTI11I	+XCFAS	Unit	805	IOQ	00FA4F80	Driver-*	UNKNOWN
AMTK10I							

Legend:

1. Name of the service to be executed.
2. Results of the executed service.

Usage Notes

- The OS/390 and JES2 commands are executed using the COMMAND service. Each OS/390 command that is executed is logged at the issuing console.
- The data set name specified (or the default data set) is not saved across sessions. You must specify a data set name, or accept the defaults, each time you restart MAINVIEW for OS/390.
- You can display the previously entered data set name by typing EXEcute without any parameters.

EXIT

The EXIT (EXI) service terminates an address space even if it does not respond to CANCEL or STOP commands from the system. This service also recovers system resources (for example, initiator, devices, data sets) by forcing an address space to terminate.

Syntax

where

<i>asname</i>	Is the address space name.
<i>(asid)</i>	Is the address space identifier in decimal format.
<i>(Xasid)</i>	Is the address space identifier in hexadecimal format.

Example

To terminate address space INVENTORY, type

```
exit inventory
```

```
AMTE22I    ADDRESS SPACE WILL BE TERMINATED BY RTM
```

Usage Note

Use the EXIT service only as a last effort. The EXIT service issues a CALLRTM to pass the job to the Recovery Termination Manager (RTM) for termination processing and does nothing to clean up after the target address space. As a result, CSA that was allocated by the address space might not be freed. Any recovery done is performed by RTM.

FINDMBR

The FINDMBR (FI) service identifies the names of all libraries allocated to the DDNAME that contain the specified member.

Syntax

where

<i>member</i>	Is the member name. When aliases are used, the true member name appears in the output.
<i>ddname</i>	Is the DDNAME.
@	Specifies your own address space; the default.
<i>asname</i>	Is the address space name.
(<i>asid</i>)	Is the address space identifier in decimal format.
(<i>Xasid</i>)	Is the address space identifier in hexadecimal format.
*	Specifies the last address space entered.

Examples

To list all members named TIME in the SYSPROC concatenation for your address space, type

```
findmbr time sysproc
```

	①		②		③
AMTFM1I	JOBNAME: TSO1		DDNAME: SYSPROC		MEMBER: TIME
AMTFMVI					

```
=====
```

	④	⑤	⑥	⑦	⑧
AMTFM2I	CT	LAST UPDT	USERID		DATA SET
AMTFMLI	1	12SEP91 14:17	BKE1		SYSP.STD.ISPPLIB
AMTFMLI	3	21AUG93 08:57	IMB1		SYS2.BOOL.BBCLIB

Legend:

1. Jobname.
2. DD name.
3. Member name.
4. Concatenation number of library within the specified DD name.
5. Date that member was last updated.
6. Time that member was last updated.
7. ID of user who updated the member last.
8. Name of data set.

To list all RESXA proc names available through the alternate JES2, type

```
findmbr resxa proclib jes2a
```

```
AMTFM1I JOBNAME: JES2A      DDNAME: PROC00      MEMBER: RESXA
AMTFMVI =====
AMTFM2I CT      LAST UPDT  USERID   DATASET
AMTFMLI 1      02JAN94 14:17 REK1      SYS1.PROCLIB
AMTFMLI 4      24MAR94 08:57 SLG1      SYS2.BOOL.PROCLIB

AMTFM1I JOBNAME: JES2A      DDNAME: PROC01      MEMBER: RESXA
AMTFMVI =====
AMTFM2I CT      LAST UPDT  USERID   DATASET

AMTFMLI 4      01APR91 08:57 LAW1      SYS2.BOOL.SYSB.PROCLIB

AMTFM1I JOBNAME: JES2A      DDNAME: PROC02      MEMBER: RESXA
AMTFMVI =====
AMTFM9I MEMBER RESXA NOT FOUND IN PROC02
```

To list the data sets that are allocated with DD name LOADLIB to the address space DWPBPAS and contain load module LGS, type

```
findmbr lgs loadlib dwpbpas

AMTFM1I JOBNAME: DWPBPAS DDNAME: LOADLIB MEMBER: LGS
AMTFMVI
=====
              ①      ②      ③
AMTFM3I CT SIZE  ALIAS OF  AC   DATASET
AMTFMLI 1 30360  MAIN      255  SYS1.ISPPLIB
AMTFMLI 3 30148  MAIN      255  SYS2.BOOL.BBPLIB
```

Legend:

- 1. Number of bytes in load module.
- 2. Alias name of member.
- 3. Authorization code for the module.

INFO

The INFO (IN) service displays information about the current operating environment. This service lets you list the release level of the operating system, the serial number and model of each CPU, and the type of IPL last performed.

Syntax

»—INFO —————«

Example

To display information about the current operating environment, type

info

```
AMTR0HI System Name=SJSE
AMTR01I SYSPROG Release 3.2.00
AMTR02I OS/390 02.09.00          FMID JBB6609  Mode=GOAL    ①
AMTR03I CPU  0 Serial Number 030204 Model 2064          ②
AMTR03I CPU  1 Serial Number 130204 Model 2064
AMTR03I CPU  2 Serial Number 230204 Model 2064
AMTR03I CPU  3 Serial Number 330204 Model 2064
AMTR04I Last IPL was COLD Start (CLPA) on 2/27/2002 at 0:25:02 from APD29I
AMTR0BI IPL used LOADC0 in SYS1.IPLPARM on volume HCD002 (8505)
AMTR0CI IEASYM list = C1
AMTR0DI IEASYS list = (C1), Source=Oper
AMTR05I TSO Version 2 Release  6 Mod 0    ④
AMTR06I VTAM Terminal ID  TCPBL226    ⑤
AMTR0EI Common Storage Tracking: CSA=ON  SQA=ON
AMTR00I
AMTR07I Volser PARMLIB Data Set Name
AMTR08I -----
AMTR09I          SYS1.PARMLIB
AMTR00I
AMTR0AI Current LNKST set is IPL
```

Legend:

1. Operating system release and its FMID.
2. Serial number for each CPU and the CPU model.
3. Type of IPL most recently performed (cold start, warm start, quick start).
4. Current release of TSO/E.
5. VTAM (or TCAM) logical terminal ID.

IO

The IO service detects potential device performance delays by displaying all outstanding non-TP I/O. Use this service to determine whether an address space is hung up because of an incomplete I/O operation, or to determine whether a device is in error recovery.

Syntax

where

- dvn* Is the device number for which outstanding non-TP I/O is to be displayed.
- volser* Is the volume serial number for which outstanding non-TP I/O is to be displayed.

Note: If you do not specify *dvn*, the IO service monitors all outstanding non-TP I/O.

Examples

To display all outstanding non-TP I/O, type

```
io
  ①      ②      ③
AMTI11I  INVENTORY UNIT 223 PACK08 IOQ 00F832A0 DRIVER-EXCP CCHH- 191 3
                ④      ⑤      ⑥
AMTI11I  * TEST      UNIT 180 333214 IOQ 00F85A00 DRIVER-VSAM      ⑦
AMTI11I  + *MASTER* UNIT 1A4 PAGEL1 IOQ 00F91300 DRIVER-ASM CCHH- 271 12
```

Legend:

- 1. A one-character flag. Valid characters are as follows:
 - blank Line represents the I/O request currently active on the device.
 - * The I/O request on this line has been queued by the I/O supervisor pending completion of a previous I/O request.

+ An ASM channel program is active on this device.

2. Address space name.
3. Device number.
4. Volume serial of the device, if it is a direct access storage or tape device.
5. IOQ address.
6. Name of IOS driver. Valid driver codes are

Code	Driver
MISC	miscellaneous driver
EXCP	EXCP driver
VSAM	VSAM driver
VTAM	VTAM driver
TCAM	TCAM driver
OLTEP	OLTEP driver
PCIFETCH	program FETCH driver
JES3	JES3 subsystem
IOSPURGE	internal IOS PURGE IOQ routine
VPSS	vector processing subsystem (3838 array processor)
CRYPTO	cryptographic subsystem
ASM	auxiliary storage manager (paging supervisor)
DYNPATH	path reconfiguration
SVC-33	IO HALT I/O SVC routine
R-CLEAR	clear device recovery
R-SUBCHN	subchannel recovery
SVCPURGE	IO PURGE I/O SVC routine
ALTPATH	alternate path recovery
MIH	missing interrupt handler
UNKNOWN	unknown or unassigned driver code in use

7. Seek address in CCHH format (DASD device only).

To display IO for volume PACK08, type

io pack08

AMTI11I	GOJOB UNIT 283	PACK08	IOQ 00F83DA0	DRIVER-EXCP	CCHH-	191	3	①
		②	③	④				
AMTI12I	UNIT B00:	RESERVES-0	ALLOCATIONS-3	OPENS-2				

Legend:

1. Device number, volume serial, IOQ and IOSB addresses of the I/O, the OS/390 I/O driver, and the seek address for this I/O operation.
2. Number of outstanding RESERVE requests for this device.
3. Number of address spaces allocating this device.
4. Number of open DCBs against this device.

Note: Message AMTI12I is displayed for DASD devices only.

IPLDATA

The IPLDATA (IPL) service displays information obtained from the Initialization Parameter Area (IPA), which is mapped by IBM macro IHAIPA.

Note: The IPL time, obtained from the IPA, can be several minutes after the start of system initialization.

Syntax

▶▶IPLDATA —————▶▶

For IEASYS parameters, the Source column indicates the source of the parameter and can be

- the name of the parmlib member from which it was obtained
- OPER, indicating that it was specified by the operator
- DEFAULT, indicating that the system default was used because the parameter was not specified

Example

To execute IPLDATA for IEASYS parameters, type

ipl

```
LPAR=SYSC, IPL on Wednesday, December 16, 1998 at 0:50:30 AM
Loadparm Unit=7D00, Volser=TSG316, SYS1.IPLPARM(LOADC6)

LCPU

The LCPU service provides the ability to display and modify the CPU time limits for an address space that were originally specified by the TIME parameter on the JOB and EXEC statements. The CPU limit for the current job step and the limit for the job (maximum for all job steps) are displayed. The CPU time used and CPU time remaining for the job step are also displayed.

If new values are specified, the step limit is reset to the specified limit value. The job limit is also reset if the current value is less than the specified value; otherwise, it remains unchanged.

The maximum CPU limit value that can be specified is 1,440 minutes, which can be specified in minutes, seconds, or a combination of both.

Syntax

where

- asname* Is the address space name. You can specify a jobname or an ASID. To specify an ASID, type (nn), where nn is the ASID in decimal; or type (Xnn), where nn is the ASID in hexadecimal. The default is the address space of the issuer.
- minutes* Is the number of minutes for the new CPU time limit. The maximum value that can be specified is 1440.
- seconds* Is the number of seconds for the new CPU time limit. You can specify the CPU time limit in minutes and/or seconds. If specifying in seconds only, you must insert two commas between the asname and the number of seconds, to indicate zero minutes.
- U A U in the third or fourth parameter position indicates that the CPU time limit for the step can be set to a value less than the current limit value.

Examples

To display the current CPU time limits and the amount of time remaining for the job and job step, type

lcpu, vam3a

①	②	③
AMTLC1I	CPU limit for job VAM3A	④ 10 minutes
AMTLC2I	CPU limit for current step ASMSTEP	④ 2 minutes, 30 seconds
AMTLC3I	Step time used	④ 1 minutes, 35 seconds
AMTLC4I	Step time remaining	④ 55 seconds
AMTLC0I	CPU limit changed ⑤	

To increase the CPU time limit for the current job step and to display the new limit values and remaining CPU time, type

lcpu, vam3a, 5

①	②	③
AMTLC1I	CPU limit for job VAM3A	④ 10 minutes
AMTLC2I	CPU limit for current step ASMSTEP	④ 5 minutes
AMTLC3I	Step time used	④ 1 minutes, 35 seconds
AMTLC4I	Step time remaining	④ 3 minutes, 25 seconds
AMTLC0I	CPU limit changed ⑤	

Legend:

1. Message number.
2. Address space name (asname).
3. Minutes and seconds fields.
4. CPU time limit message lines.
5. Notification of changed CPU limit.

LLIST

Note: The LLIST service provides support for systems prior to OS/390 version 1.3. The LNKLIST service provides support for the dynamic LNKLIST facility in OS/390 version 1.3 and later.

The LLIST (LL) service

- lists the names of all libraries in the link list and the number of extents that exist for each library when the link list is built
- determines which link list library or libraries contain a specified module
- lets you dynamically rebuild the link list

The operating system does not let you add or delete link list data sets without IPLing the system. New modules added to a link list data set can exceed the free space within the existing extents, causing a new extent to be added to the data set. Abend 106-F results when these new modules are accessed because they reside outside of the extents that existed when the link list was created. Normally, an IPL is required to permit access to these new modules. The LLIST service lets you to rebuild the link list dynamically, eliminating the need for an IPL.

If LLA manages the link list, you must use the LLA parameter when you build the link list. The LLA parameter includes two suffixes: *yy* and *zz*. These suffixes refer to CSVLLA members that reside in the library pointed to by IEFPARM in the LLA address space (by default, SYS1.PARMLIB). CSVLLA_{yy} removes the link list from control of the LLA address space before the BUILD process; CSVLLA_{zz} places the link list back under control of the LLA address space after the BUILD process is completed.

See “Usage Notes” on page 4-101 for more information on the LLA parameter.

Syntax

where

<i>module name</i>	Is the name of the module to search for in the link list libraries.
ALL	Causes all libraries containing the module to be listed; the default.
FIRST	Stops the search at the first occurrence of <i>module name</i> .
BUILD	Creates a new dynamic link list.
xx	Is a two-character suffix of a LNKLIST member in SYS1.PARMLIB used to create the new link list. You can specify from one to seven suffixes. There is no default.
APF	Is an optional parameter that signals you to use the in-storage APF list to determine whether data sets should be authorized. If you omit this parameter, all link list data sets are authorized.
yy	Is the suffix of a CSVLLA member that specifies the removal of the link list data set concatenation from control of the LLA address space before a new dynamic link list is created.
zz	Is the suffix of a CSVLLA member that places the link list data set concatenation back under control of the LLA address space after a new dynamic link list is created.

Note: Use suffixes yy and zz only if your system uses LLA. These suffixes refer to CSVLLA members that reside in the library pointed to by IEFPARM in the LLA address space. By default, this library is SYS1.PARMLIB.

Examples

To list all data set names in the link list, type

l1list

```
AMTL76I LINKLIST HAS BEEN REBUILT ON 01/23/96 AT 12:34:55 BY TSOID1
      ①      ②      ③      ④
AMTL70I VOLSER EXT APF DATASET NAME
AMTL71I SYSR1C  1 YES SYS1.LINKLIB
AMTL71I SYSR1C  1 YES SYS1.MIGLIB
AMTL71I SYSR1C  1 YES SYS1.CMDLIB
AMTL71I BAB012  1 NO  SYS1.CORP.BBLINK
AMTL71I BAB031  1 NO  SYS1.CORP.BBLOAD
AMTL71I TSG006  1?YES SYS2.USER.SHRDLIB
AMTL72I ** WARNING **  DATASET NOW HAS    4 EXTENT(S) ⑤
AMTL71I TSG006  1 YES SYS2.SYSB.SHRDLIB
AMTL71I TSG005  1 YES SYS2.SHRD.SHRDLIB
AMTL71I BAB014?  2 NO  NML1.ASM.LOAD
AMTL77I ** WARNING **  DATASET IS NOW CATALOGED ON BAB048 ⑥
AMTL71I SYSR2C  1 NO  PLI.PLILINK
AMTL71I TSG006  1 NO  SYS2.V2R1M0.GDDMLOAD
```

Legend:

1. Volume where link list library resides at the time the link list is built.
2. Number of extents allocated at the time the link list is built.
3. Indicates whether data set is APF-authorized.
4. Name of the data set.
5. Issued if additional extents are added to this data set after the link list is built.
6. Issued when the data set is recataloged to a different volume, which occurs after the link list is built.

To list all link list data set names that contain module IEFACTRT, type

l1list iefactrt

```
AMTL73I MODULE IEFACTRT FOUND IN STEPLIB DATASET ①
AMTL74I MODULE IEFACTRT FOUND IN LINKLIST DATASET(S)
AMTL70I VOLSER EXT APF DATASET NAME
AMTL71I SYSR1C  1 YES SYS2.CORP.BBLINK
AMTL71I SYSR1C  1 NO  SYS2.SHRD.SHRDLIB
```

Legend:

1. Issued if the specified module is also found in the STEPLIB concatenation.

To build the link list using the definitions contained in SYS1.PARMLIB members LNKLIST00, LNKLIST01, and LNKLIST33, using the in-storage APF list to determine whether data sets should be authorized, type

l1ist build 00 01 33 apf

				①	②	
AMTL80I	VOLSER	EXT	APF	MBR	DATASET	NAME
AMTL81I	SYSR1C	1	YES		SYS1.LINKLIB	
AMTL81I	SYSR1C	1	YES		SYS1.MIGLIB	
AMTL81I	SYSR1C	1	YES	00	SYS1.CMDLIB	
AMTL81I	BAB012	1	NO	00	SYS1.CORP.BBLINK	
AMTL81I	BAB031	1	NO	00	SYS1.CORP.BBLOAD	
AMTL81I	TSG006	2	YES	01	SYS2.SYSB.SHRDLIB	
AMTL81I	TSG005	1	YES	01	SYS2.SHRD.SHRDLIB	
AMTL81I	TSG006	13	YES	01	SYS2.USER.SHRDLIB	
AMTL81I	TSG006	1	NO	33	SYS2.V2R1M0.GDDMLOAD	
AMTL81I	SYSR2C	1	YES	33	PLI.PLILINK	
AMTL81I	BAB023	1	NO	33	NML1.TEST.LINKLIB	
AMTL8KA	REPLY Y TO CONFIRM NEW LINKLIST, N TO CANCEL INPUT					
Y						
AMTL8CO	PLEASE WAIT A MOMENT WHILE LLA PROCESSES LNKLIST					
AMTL8EI	NEW LINKLIST DATASETS ARE NOW ACTIVE					

Legend:

1. Suffix for the LNKLIST member of SYS1.PARMLIB that contains the definition for each data set.
2. Name of the data set.

Note: To activate the new link list, type **Y** in response to message AMTL8KA.

Usage Notes

- `SYS1.LINKLIB` must be the first data set in the link list; it is added automatically as the first data set and is ignored in any other location. The new link list can contain a maximum of 255 extents.
- If you are using a third-party software program with a function similar to LLA, stop that program before creating a new dynamic link list and start it again after creating a new dynamic link list.
- If you are using LLA on your system and do not specify the `yy` and `zz` suffixes, LLIST uses the default suffixes in BBPARM library member `$$INSYS0`. You have the option of defining these default suffixes during the AutoCustomization process.
- If you have not defined the `yy` and `zz` suffixes in BBPARM library member `$$INSYS0`, and you omit them when you type the LLIST command, the LLIST service will build the link list only
 - if you are not using LLA
 - in an ESA environment where the link list is not under control of LLA

LNKLST

The LNKLST service provides the ability to

- create, modify, and delete LNKLST sets
- make a LNKLST set the active (current) set
- switch address spaces to the current set
- display related information

The LNKLST service will also search the user's JOBLIB/STEPLIB, the LPA, and the current LNKLST set for a specified load module and display where it was found.

Note: The LNKLST service provides support for the IBM dynamic LNKLST facility implemented in OS/390 version 1.3 and, therefore, is not supported on earlier operating systems. However, the LLIST service continues to provide similar functions for systems prior to OS/390 version 1.3.

General Information

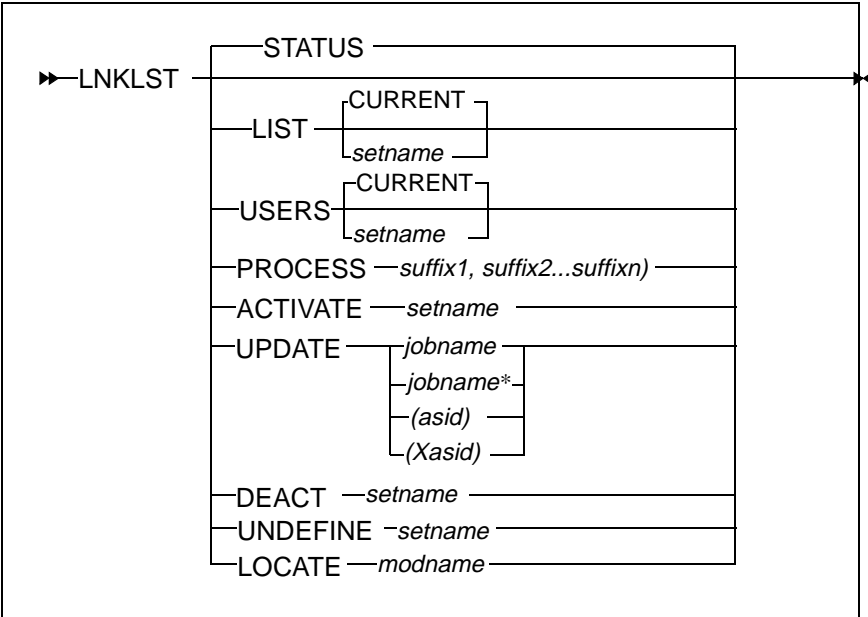

The IBM Dynamic LNKLST facility introduced the concept of LNKLST sets. Each address space in the system is assigned to a LNKLST set. A LNKLST set defines the data sets that compose the LNKLST for the address spaces using that LNKLST set. LNKLST set names are one to 16 characters in length. The initial set is named IPL. The IPL set cannot be modified. New address spaces are assigned to the CURRENT set. The name CURRENT is generic and refers to the current LNKLST set, regardless of its actual name.

Here is a list of what you can and cannot do with LNKLST and its various functions:

- You cannot modify or UNDEFINE a LNKLST set that has address spaces assigned to it.
- You can use the LNKLST DEACT function or the LNKLST UPDATE function to switch address spaces to the current LNKLST set.
- You can use the LNKLST ACTIVATE function to make the specified LNKLST set the current LNKLST set.
- You can use the LNKLST PROCESS function to copy an existing LNKLST set, add data sets to an existing set, or delete data sets from an existing set.

- You can use the LNKLST UNDEFINE function to remove an existing LNKLST set from the system.
- You can use the functions STATUS and USERS to display information about the existing LNKLST sets and the address spaces assigned to them.
- You can use the LOCATE function to search the data sets in the current LNKLST set for the specified load module and display the name of the data set containing the load module.

Syntax

Note: All function keywords (first parameter) can be abbreviated to their first three letters.

where

STATUS	Displays a list of the defined LNKLST sets and the number of address spaces using each LNKLST set. <ul style="list-style-type: none">• A plus sign (+) preceding a set name indicates that it is the current LNKLST set.• A minus sign (-) preceding a set name indicates that the set had been the current set at one time.
LIST	Displays a list of the data sets in the specified LNKLST set and their sequence number, volser, APF, and SMF status. If a set name is not specified, the current set is displayed.

USERS	Displays a list of address spaces currently assigned to the specified LNKLST set. If a set name is not specified, the current set is displayed.
PROCESS	Allows you to process a LNKLST set. You must specify at least one suffix.
ACTIVATE	Allows you to make the specified LNKLST the current set. You must specify a LNKLST set name.
UPDATE	Switches one or more address spaces to the current LNKLST set. You must specify a jobname or ASID.
DEACT	Switches all address spaces assigned to the specified LNKLST set to the current LNKLST set.
UNDEFINE	Removes the specified LNKLST set from the system.
LOCATE	Searches the JOBLIB/STEPLIB, LPA, and the current LNKLST set for the specified load module and displays its location.

Examples

This section provides examples on how to use the LNKLST functions.

LIST

To display a list of the data sets in the IPL set, type

LNK,LIST,IPL

To display a list of the data sets in the current LNKLST set, type

LNK,LIST

or

LNK,LIST,CURRENT

USERS

The USERS function displays a list of the address spaces currently assigned to the specified LNKLST set. If a set name is not specified, information for the current LNKLST set is displayed. The information includes the set name, current number of address spaces, the ASID (in hexadecimal), and the jobname for each address space.

To display a list of the address spaces using the IPL set, type the following command:

LNK,USE,IPL

To display a list of the address spaces using the current set, type the following command:

LNK,USE

PROCESS

The primary purpose of PROCESS is to create new LNKLST sets and modify existing sets. However, the functions UPDATE and UNDEFINE are supported as well.

PROCESS reads the specified PROG_{xx} members and processes the following statements:

- LNKLST DEFINE
- LNKLST ADD
- LNKLST DELETE
- LNKLST UPDATE
- LNKLST UNDEFINE

Other statements (APF, EXIT SYSLIB, LNKLST TEST, and LNKLST ACTIVATE) are ignored.

Specify the suffixes of the PROG_{xx} members that you want to process as the second parameter of the command. If you specify more than one suffix, you must enclose them in parentheses. For example, the following command will process members PROG01 and PROG03:

LNKLST,PRO,(01,03)

Creating a new LNKLST set or modifying an existing set is a two-step process.

- First, you need to create a PROG_{xx} member in a data set included in the logical PARMLIB concatenation (formerly SYS1.PARMLIB).
- Second, use LNKLST, PROCESS to process the statements in PROG_{xx}.

To identify the data sets that are to be included in the new or modified LNKST set, use the PROGxx statements:

LNKLST DEFINE
LNKLST ADD
LNKLST DELETE

Note: If your PROGxx member contains symbols, they are replaced with their current value.

For example, assume that you want to add a new data set called SYS2.MYLIB to the beginning of the current LNKST, which is the IPL LNKST set. Because you cannot modify the IPL set, you create your own LNKST set (called MYSET) by copying the IPL set, and then adding your data set to the copy.

First, create PARMLIB member PROGMY containing a LNKST DEFINE statement with the *COPYFROM* parameter to define the new set, and then copy the data sets from the IPL set. Also include a LNKST ADD statement to add your data set after SYS1.CSSLIB.

PROGMY

```
lnklst define name(myset) copyfrom(ipl)
lnklst add      name(myset) dsname(sys1.mylib) attop
```

Note: See the IBM publication, *OS/390 MVS Initialization and Tuning Reference*, for an explanation of the LNKST statement used in member PROGxx.

Then use the following LNKST command to process the member you have created:

LNK,PRO,MY

At this point, you have created LNKST set MYSET. It is available now but will not be used until it has been activated. Once activated, new address spaces will be assigned to it, but the existing address spaces will continue to use the IPL set until you use either DEACT or UPDATE to switch address spaces to the current set.

If you want to have all address spaces use your new LNKST set, you could execute the following commands to make LNKST set MYSET the current set and transfer all address spaces using set IPL to the current set:

LNK,ACT,MYSET
LNK,DEACT,IPL

ACTIVATE

The ACTIVATE function makes the specified LNKLST set the current LNKLST set.

Type the following command to make LNKLST set MYSET the current LNKLST set:

LNK,ACT,MYSET

UPDATE

The UPDATE function switches one or more address spaces to the current LNKLST set. You can specify a jobname or an ASID. If you specify a jobname, you can use the wildcard characters * and ? to select a group of jobs. You can specify an ASID in hexadecimal or decimal format. Indicate that the value is an ASID by enclosing it in parentheses. Indicate that it is a hexadecimal value by prefixing it with an X. Therefore, (123) is a decimal ASID, and (X123) is a hexadecimal ID, equivalent to (291).

Type the following command to switch all address spaces to the current LNKLST set:

LNK,UPDATE,*

Type the following command to switch all jobs (and TSO users), starting with jobnames beginning with the letters ABC to the current set:

LNK,UPD,ABC*

Type the following command to switch all jobs (and TSO users), with ABC as the first three characters of the jobname, any character in the fourth position, a 1 in the fifth position, and any characters in the remaining three positions:

LNK,UPD,ABC?1*

DEACT

The DEACT function switches all address spaces assigned to the specified LNKLST set to the current LNKLST set.

Type the following command to switch all address spaces assigned to LNKLST set MYSET to the current set:

LNK,DEACT,MYSET

UNDEFINE

The UNDEFINE function removes the specified LNKLST set from the system. A LNKLST set cannot be removed if any address spaces are using it. In addition, the IPL set cannot be removed.

Note: You can use DEACT to switch all of the address spaces to the current set.

Type the following command to remove LNKLST set MYSET from the system:

LNK,UND,MYSET

LOCATE

The LOCATE function searches the JOBLIB/STEPLIB, LPA, and current LNKLST set for the specified load module. If the module is found in the JOBLIB/STEPLIB concatenation, the concatenation number is displayed (the first data set is number 1). If the load module is found in the current LNKLST set, the name of the data set in which it was found is displayed.

LOADLPA

The LOADLPA (LOA) service lets you add modules or SVCs in LPA without needing to re-IPL. This service also lets you delete modules added by this service.

Syntax

where

LIST	Lists information for all active modules. A module is considered active if it was loaded by the ADD function and has not been deleted. The LIST function is the default.
ADD	<p>Loads a module and all of its aliases; it also places the module on the active LPA queue. Modules are loaded from the load library with a DD name of USERLIB, unless a data set name is specified as the third parameter.</p> <p>If you specify a module that was previously loaded by the ADD function, the module is loaded at a new location because the entry point changes. The previously loaded copy is deleted (see the description of the DEL function).</p>
<i>modname</i>	Is the name of the module that is to be added, deleted, or freed.
<i>dsname</i>	Is the name of the data set where <i>modname</i> resides. LOADLPA dynamically allocates the data set specified before loading <i>modname</i> into LPA. If no data set name is specified, LOADLPA tries to find <i>modname</i> in the DD concatenation USERLIB. Note that USERLIB must have been previously allocated to the same address space where SYSPROG Services is currently executing. (When SYSPROG Services is running under MAINVIEW for OS/390 from the SYSPROG Services menu, this address space is PAS.)

DEL	<p>Deletes a module and its aliases loaded by the ADD function. All saved entry-point addresses are restored, and the module is removed from the active LPA queue. The module's storage is freed if the module's use count is zero and if the module does not contain an SVC entry point. See the description of the FREE function for information about how to recover storage for these modules.</p> <p>If you specify ALL, LOADLPA deletes all modules and aliases previously loaded by the ADD function.</p>
FREE	<p>Frees storage for a deleted module whose use count is zero. Storage is not freed when the use count is greater than zero because a non-zero use count implies that the module is still in use.</p> <p>You can repeat the LOADLPA FREE command at a later time. You can also use this function when the deleted module contains an entry point for an SVC.</p> <p>If you specify ALL, deleted modules with use counts of zero are freed.</p>

Examples

To add the USERMOD module, which is found in LGS1.LOADLIB, type

```
loadlpa add usermod lgs1.loadlib
```

```
      ①      ②      ③      ④
AMTL5HI NAME=USERMOD,    EP=00B41000, CDE=F47AD0, TIME=17:13
      ⑤      ⑥
AMTL5JI      LA=00BA4100, LEN=0022CE
AMTL5KI ALIAS=USEREP1,    EP=00BA4140, CDE=F47B00 ⑦
AMTL5KI ALIAS=USEREP2,    EP=00BA4440, CDE=F47B30 ⑦
AMTL5LI LOADLPA ADD FUNCTION COMPLETED
```

Legend:

1. Name of module loaded.
2. Address of module entry point.
3. Address of the contents directory entry (CDE) created for this module.
4. Time module was loaded.
5. Address of module.
6. Length of module.
7. Name, entry point address, and CDE address for all aliases found in the specified module for this module.

To delete the USERMOD module from LPA, type

```
loadlpa del usermod
```

```
AMTL65I MODULE USERMOD DELETED
AMTL5PI LOADLPA DELETE FUNCTION COMPLETED
```

To free module storage if the use count in the major CDE is reduced to zero, or to free storage for a module that contains an SVC entry, type

```
loadlpa free usersvc
```

```
AMTL67I MODULE USERSVC FREED
AMTL6AI LOADLPA FREE FUNCTION COMPLETED
```

Usage Notes

- Entry points of some operating system routines are maintained in system control blocks. The entry points used for specific modules and control blocks depend on the operating system, release level, and maintenance level. The LPA active queue is the only control block that LOADLPA updates. Therefore, programs that do not use LINK, LOAD, ATTACH, or XCTL to access the module are unaffected by LOADLPA.
- LOADLPA can delete only the module and aliases that LOADLPA loads.
- The SVC table is updated with an entry point address for any module name (true name or alias) that conforms to SVC naming conventions. If necessary, you can use the ZAP service to update the SVC table to change the locks. All types of extended SVCs are supported. In all cases, the old entry point address is saved and then restored when the module is deleted by the LOADLPA delete function. Use the ZAP service to reset the locks. See “SVC FIND” on page 4-217 and “ZAP” on page 4-253 for more information.
- Using LOADLPA, you can either add to or delete from LPA the SVC names that end with X'C0' (such as type 4 SVC 250) by substituting a left brace ({) for the last characters of the module name; for example:

```
LOADLPA ADD IGC0025{
```

- When you add an extended SVC with the LOADLPA service, the entry point address in the Extended SVC Router (ESR) table is updated. However, the flags in the second word of the ESR table entry are not changed. Use the ZAP service to reset flags, if required.
- Modules loaded by the LOADLPA service are logically added to the LPA but physically reside in CSA storage.

LOG

The LOG service controls the logging system. The logging system provides the ability to periodically execute a set of services with the output directed to a data set that you specified.

Syntax

where

xx	Is the suffix of the \$\$INLGxx member used to start logging. The \$\$INLGxx member contains control statements that define the services to be executed and control the logging process, including the output data set. This parameter also implies start.
dsname	Is the name of the partitioned data set that contains the \$\$INLGxx member. If this parameter is omitted, the name you last specified is used. If you did not previously specify a dsname, the data set allocated to DDNAME BBPARM is used.
STOP	Indicates that logging is to be stopped.
FREE	Indicates that the logging output data set is to be freed. FREE implies stop.
STATUS	Indicates that the status of the logging system is to be displayed.

\$\$INLGxx Control Statements

The verb (statement type) must begin in column 1. One or more blanks are allowed between the verb and the operand. Operands cannot extend beyond column 72.

CLASS c	Indicates that the logging output is to be written to a SYSOUT data set of the specified class. CLASS is mutually exclusive with the DSN statement.
---------	---

CMD <i>Command</i>	Is a command that is to be periodically executed. Use multiple CMD statements for multiple commands. Commands are executed in the order that they appear.
CNT <i>n</i>	Specifies that logging is to be terminated when <i>n</i> number of cycles have been executed. Also, see also STOP <i>hhmm</i> .
DSN <i>dsname</i>	Specifies that logging output is to be written to the preallocated data set <i>dsname</i> . If no CLASS or DSN statement is provided, and a data set has been allocated to DDNAME LOG, the output will be written to that data set. Otherwise, it will be written to SYSOUT=A.
EJC	Indicates the output produced by the command that follows should start on a new page. The EJC statement should be followed by one or more CMD statements.
INCR <i>n</i>	Indicates the number (<i>n</i>) of seconds (increment) in an interval. The default is 30 seconds. The product of INCR and INT determines the number of seconds between logging cycles.
INT <i>n</i>	Indicates the number (<i>n</i>) of intervals in a logging cycle. The default interval is one. The product of INCR and INT determines the number of seconds between logging cycles.
START <i>hhmm</i>	Indicates the time (<i>hhmm</i>) that logging is to start. Specify 1300 for 1:00 P.M. Logging starts immediately if you do not provide a START statement.
STOP <i>hhmm</i>	Indicates the time (<i>hhmm</i>) that logging is to terminate. Specify 1200 for 12:00 P.M. (noon) and 2400 for 12:00 A.M. (midnight). If you provide both CNT and STOP statements, logging will terminate when the first condition is reached.
HOLD	Indicates that the SYSOUT output is to be held. If neither HOLD nor NOHOLD are specified, the default for the SYSOUT class will prevail. The HOLD statement is ignored if logging output is not written to a SYSOUT data set.
NOHOLD	Indicates that the SYSOUT output is <i>not</i> to be held. If neither HOLD nor NOHOLD are specified, the default for the SYSOUT class will prevail. The NOHOLD statement is ignored if logging output is not written to a SYSOUT data set.
MAXOUT <i>n</i>	Indicates the maximum number (<i>n</i>) of lines that will be written to a SYSOUT data set. Logging will be terminated when <i>n</i> lines have been written to SYSOUT. You can specify up to eight digits. The default is to write an infinite number of lines. MAXOUT is only applicable to SYSOUT data sets.

Examples

Member \$\$INLG01

```
INCR 60
INT 5
DSN VAM3.LOG
START 2200
STOP 2259
CMD CSA,MAP
```

Member \$\$INLG01 will cause the command CSA,MAP to be executed once every five minutes between 10:00 P.M. and 10:59 P.M. The output will be written to data set VAM3.LOG.

Member \$\$INLG02

```
INCR 30
INT 2
CNT 60
HOLD
CLASS A
CMD MTP
CMD ENQ
CMD CPU 5
```

Member \$\$INLG02 causes the commands MTP, ENQ, and CPU 5 to be executed once a minute for a total of 60 times. The output will be written to SYSOUT Class A and placed on the HOLD queue.

LPA

The LPA service finds modules that are located in any of the system link-pack areas. This service also determines whether a given address lies within the base or extended system link-pack area (LPA), fixed link-pack area (FLPA), or modified link-pack area (MLPA).

Syntax

where

<i>module name</i>	Is the name of the module you want to locate within the link-pack area.
SKIP	Finds the second occurrence of the module.
<i>module address</i>	Is a virtual address returning the name of the module occupying that address.
LOC	Is required when specifying an address you want to process.

Examples

To locate module IEFJRASP in the system link-pack areas, type

```

lpa iefjrasp
      ①           ②
AMTL41I  MODULE=IEFJRASP  [ EMLPA ]
      ③           ④           ⑤           ⑥
AMTL42I  LA=019EEA28  EP=019EEA28  (AMODE-31)  LEN=000928
      ⑦
AMTL43I  CDE=00FDD020

```

Legend:

1. Requested module name.
2. Location in the link-pack area where the module resides:

PLPA	Pageable link-pack area
EPLPA	Extended pageable link-pack area
MLPA	Modified link-pack area
EMLPA	Extended modified link-pack area
FLPA	Fixed link-pack area
EFLPA	Extended fixed link-pack area

3. Load address for the module.
4. Entry-point address for the module.
5. Addressing mode of the module entry point.
6. Length of the module.
7. Address of the Link Pack Directory Entry (LPDE) or the CDE address is displayed. A CDE exists only when the module is on the Active Link Pack Area Queue (ALPAQ).

To find the next copy of module IEFJRASP that resides in the PLPA, type

lpa iefjrasp skip

```
AMTL41I MODULE=IEFJRASP [ PLPA ]
AMTL42I LA=1013A000 EP=1013A000 (AMODE-31) LEN=000928
```

To locate module IDCAM01, which has an alias entry point of DEFINE, type

lpa define

①

```
AMTL40I ENTRY=DEFINE EPLOC=00E4F83C (AMODE-24)
AMTL41I MODULE=IDCAM01 [ PLPA ]
AMTL42I LA=00E4F000 EP=00E4F100 (AMODE-24) LEN=01A430
```

Legend:

1. Alias entry point to the module listed in the AMTL41I message.

To locate the module with the address 19A032A, type

lpa 19a032a loc

	①	②	③
AMTL44I	LOC 019A032A	IS +00332A	FROM EPLPA ENTRY IEECB905
AMTL42I	LA=0199D000	EP=0199D000	(AMODE-31) LEN=00F7F0
AMTL43I	CDE=00FDE130		

Legend:

1. Address supplied as input.
2. Hexadecimal offset of the supplied address from the LPA entry point in which the address resides.
3. Name of the closest LPA entry point to the supplied address.

Usage Note

The LPA service sets the location pointer (*) to the specified entry point for the module. Therefore, you can use the DUMP service to display the storage beginning at the entry point by typing the command **DUMP,***.

Note: The wait limit is the amount of time the address space can remain in a continuous wait.

<i>asname</i>	Is the address space name. You can specify a jobname or an ASID. To specify an ASID type (<i>nn</i>), where <i>nn</i> is the ASID in decimal, or type (<i>Xnn</i>), where <i>nn</i> is the ASID in hexadecimal. This is a required field.
<i>hours</i>	Number of hours for the new wait limit.
<i>minutes</i>	Number of minutes for the new wait limit. You can specify the wait limit in hours and minutes or minutes only. If specifying in minutes only, you must insert two commas between the <i>asname</i> and the number of minutes to indicate zero hours.
U	A U in the third or fourth parameter position indicates that the wait limit can be set to a value less than the current limit value.

Examples

To display the wait limit and the amount of time the job has been in a wait state, type

lwait,vam3w1

①	②	③	④	⑤
AMTLW1I	VAM3W1			
AMTLW4I	Has been waiting for	⑥		4 minutes, 37 seconds
AMTLW5I	Wait limit remaining	⑥	1 hours,	55 minutes, 22 seconds
AMTLW6I	Wait limit is	⑥	2 hours,	00 minutes
AMTLWoI	Wait limit changed	⑦		

To increase the wait limit to three hours, type **LWAIT, VAM3W1,3**. The new wait limit is displayed:

lwait,vam3w1,3

①	②	③	④	⑤
AMTLW1I	VAM3W1			
AMTLW4I	Has been waiting for	⑥		4 minutes, 58 seconds
AMTLW5I	Wait limit remaining	⑥	2 hours,	55 minutes, 22 seconds
AMTLW6I	Wait limit is	⑥	3 hours,	00 minutes
AMTLWoI	Wait limit changed	⑦		

The request to set the wait limit to 30 minutes was denied because the current wait limit is a larger value (one hour) and U was not specified.

lwait,vam3w1,,30

①	②	③	④	⑤
AMTLW1I	Request denied. New value is less than old value.			
AMTLW1I	VAM3W1			
AMTLW5I	Has been waiting for	⑥		6 minutes, 45 seconds
AMTLW4I	Wait limit remaining	⑥		53 minutes, 14 seconds
AMTLW6I	Wait limit is	⑥	1 hours,	00 minutes
AMTLWoI	Wait limit changed	⑦		

The wait limit is reduced to 30 minutes, as requested. Note that U was specified to allow the reduction.

lwait,vam3w1,,30,u			
①	②	③	④
⑤			
AMTLW1I	VAM3W1		
AMTLW4I	Has been waiting for	⑥	7 minutes, 10 seconds
AMTLW5I	Wait limit remaining	⑥	22 minutes, 49 seconds
AMTLW6I	Wait limit is	⑥	30 minutes
AMTLWoI	Wait limit changed	⑦	

Legend:

1. Message number.
2. Address space name (asname).
3. Hours field.
4. Minutes field.
5. Seconds field.
6. Wait limit message lines.
7. Notification of changed wait limit.

LX

The LX service displays information for system linkage indexes (LXs). This service displays the maximum (total) number of system LXs, which are subdivided into dormant, available, and active.

The LX service displays the LXs assigned to the specified address space.

For dormant LXs, the following results are displayed when available:

- LX number
- jobname and ASID of the last address space to use the LX
- approximate time and date that the LX became dormant

Additionally, information can be displayed for all LXs, a specified LX, or all LXs assigned to a jobname or ASID.

Syntax

where

- | | |
|----------------|--|
| <i>number</i> | Is the LX number. |
| <i>asname</i> | Is the address space name. |
| <i>(asid)</i> | Is the address space identifier in decimal format. |
| <i>(Xasid)</i> | Is the address space identifier in hexadecimal format. |
| ALL | Indicates all system LXs. |

Type	To
LX	Display the current system LX status and information for dormant LXs.
LX 23	Display information for LX number 23 (decimal).
LX ALL	Display information for all system LXs.
LX (X123)	Display information for all system LXs assigned to ASID x0123.
LX PCAUTH	Display information for all system LXs assigned to the specified address space.

Definitions

Term	Definition
Total LXs	The maximum number of system LXs. The total number of LXs is the sum of the number of dormant, available, and active LXs. The maximum number of system LXs is controlled by the parameter NSYSLX in PARMLIB member IEASYSxx.
Dormant	The address space that acquired or last used the LX has terminated. System LXs are not reassigned. However, the original requester can choose to reconnect to the LX at a future time.
Available	A system LX that has never been assigned.
Active	System LXs that have been assigned by the system and are not dormant.
Owned	An LX that has been assigned. It can be either active or dormant.
LX	Linkage Index number.

Example 1

```

MCOMMAND

Alias for COMMAND. See the service “COMMAND” on page 4-31.

MDEVICE

The MDEVICE (MDEV) service monitors all or selected devices attached to all processors in the configuration sampled within a 15-second interval. The MDEVICE service

- monitors the I/O activity of all devices and address spaces (it can also monitor the I/O activity of a specified device or address space)
- detects I/O bottlenecks that cause workload delays

Syntax

where

<i>dvn</i>	Is a device number.
<i>dvn1-dvn2</i>	Is a range of device numbers; <i>dvn1</i> is the lowest device number and <i>dvn2</i> is the highest device number.
<i>time</i>	Specifies the length of the sample period in seconds. The default sample period is 15 seconds.

Examples

To monitor all devices for 15 seconds, type

mdevice

AMTO50I I/O DEVICE DATA BEING GATHERED

AMTO51I I/O DEVICE ACTIVITY REPORT

	①	②	③	④	⑤	⑥	⑦	⑧	⑨	⑩
AMTO36D	-----									
AMTO36H	DEV	VOLSER	%BSY	QLTH	SEEK	ACYL	RATE	CONN	PEND	DISCT
AMTO36I	B02	TSG002	45	.66	7	199	22	9	3	11
AMTO38D	-----									
	①	②	③							
AMTO38H	ASIDNAME		ASID	%BSY						
AMTO38I	WKR1		85	33						
AMTO38I	INIT		24	22						
AMTO38I	JES2		13	11						
AMTO38I	CMR8		77	33						

Legend:

1. Device number whose activity was measured.
2. Volume serial number on the device measured.
3. Percentage of time an I/O request was active for the device.
4. Average number of I/O requests that were queued by the OS/390/XA I/O supervisor for the device.
5. Total number of head movements observed for the device during the interval (N/A for non-DASD and fixed-head devices).
6. Average number of cylinders moved for each seek observed for the device.
7. Number of I/O requests per second addressed to this device.
8. Average time (in milliseconds) that the device was connected to a channel path on a per-request basis.
9. Average time (in milliseconds) that each request was held, pending availability of a wait for path, device, or control unit.

10. Average time (in milliseconds) that the device was disconnected from the channel path pending a device or control unit function (seek) on a per-request basis.
- ❶ Name of an address space found to be a significant user of the device. In this field, ***** indicates that the address space terminated between the time that the data was collected and the time that the MDEVICE report was generated. *OTHERS* in this field indicates that the address space had more users during the monitoring period than could be listed. All activity for the overflow of users is reported as *OTHERS*.
- ❷ Address space ID found to be a significant user of the device.
- ❸ Percentage of the device busy time that this address space was requesting the device.

Usage Note

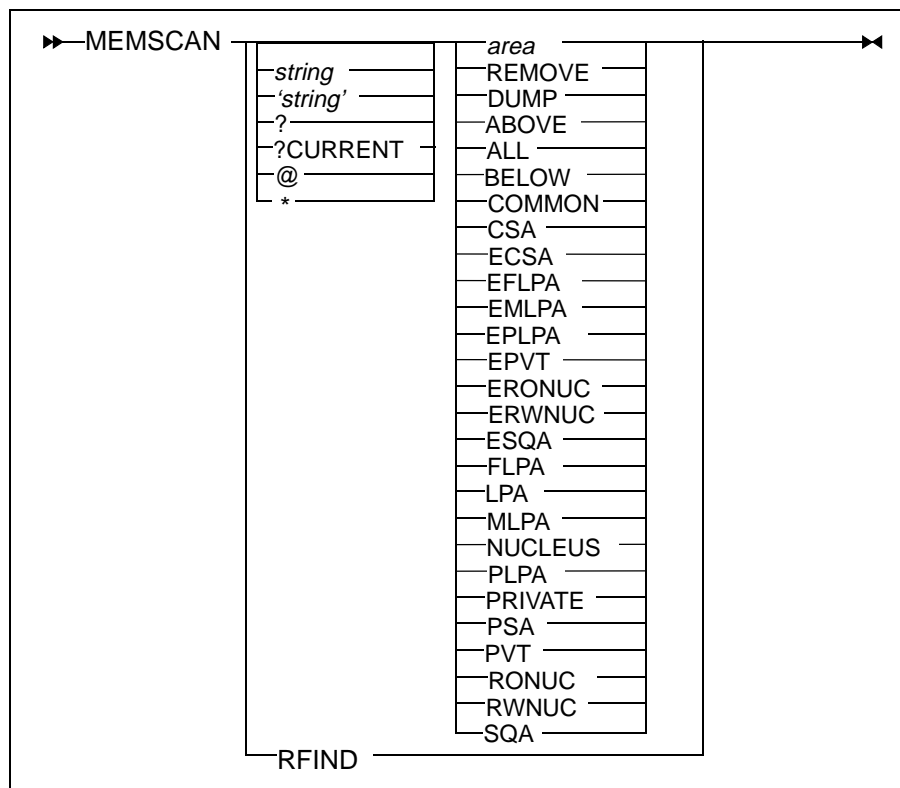

The MDEVICE service uses a sampling technique for measuring I/O activity. The default sampling period is 15 seconds at a rate of four samples per second. If you enter an override value for time, the sample rate is four samples per second if the period is 15 seconds or less and two samples per second if the period is greater than 15 seconds.

MEMSCAN

The MEMSCAN (ME) service scans the specified storage areas for the specified character or hexadecimal string and displays the location of each occurrence of the string. In addition, a symbol of the form @nn is created for each string occurrence until 99 symbols have been created. You can use these symbols in conjunction with the DUMP and ZAP services to display or modify the located data.

When 99 symbols have been created, MEMSCAN displays 64 bytes of storage containing the next occurrence of the string and then terminates. You can resume the scan to find the next occurrence by typing MEMSCAN without any operands. You can use an asterisk (*) to reference the address of the last occurrence of the string symbolically on the DUMP, EQUATE, and ZAP services.

Syntax

where

<i>string</i>	Character strings that do not contain commas or blanks can be typed directly. Strings containing blanks or commands must be enclosed in single quotation marks (for example: 'ABC,DEF'). Characters typed in lowercase are converted to uppercase. Type strings as hexadecimal data to search for lowercase.
' <i>string</i> '	Hexadecimal data must be enclosed in single quotation marks and preceded by an X. For example: X'C1C2C36BC4C5C6'.
?	Displays a map of storage depicting the various areas within the address space.
@	Displays the symbols previously created by MEMSCAN.
*	Represents the address of the last location set by one of several services. Typing an asterisk is equivalent to entering the address as a hexadecimal string. See "Example 1" on page 4-132.
Null	Omitting all parameters or omitting the first parameter causes MEMSCAN to resume an interrupted search.
<i>area</i>	Subsequent parameters (2nd through 10th) as described in the "Area Keywords" section.
RFIND	Finds a previous scan.

Note: You can specify up to 10 parameters.

Area Keywords

Any of the following keywords can be specified in any sequence, separated by commas or blanks. Only the first three letters of each keyword are required. Area keywords are cumulative in their effect. If an area keyword is not specified, the default is COMMON.

REMOVE	Causes any previously created symbols of the format @nn to be deleted prior to starting the scan (where nn is 01 through 99).
DUMP	Causes MEMSCAN to display 64 bytes of storage surrounding each occurrence of the string.
ABOVE	Scans all storage above the 16-megabyte line.
ALL	Scans all storage (0 through 7FFFFFFF).
BELOW	Scans storage below the 16-megabyte line.
COMMON	Scans common storage, which comprises CSA, ECSA, SQA, and ESQA. The PSA, LPA, and nucleus area, although in common storage, are excluded.

CSA	Scans the Common Service Area (CSA) located below the 16-megabyte line.
ECSA	Scans the Extended Common Service Area.
EFLPA	Scans the Extended Fixed Link-Pack Area.
EMLPA	Scans the Extended Modified Link-Pack Area.
EPLPA	Scans the Extended Pageable Link-Pack Area.
EPVT	Scans the Extended Private area. Only the private area of the address space within which the SYSPROG Services service is executing is scanned.
ERONUC	Scans the Extended read-only nucleus.
ERWNUC	Scans the Extended read/write nucleus.
ESQA	Scans the Extended System Queue Area.
FLPA	Scans the Fixed Link-Pack Area.
LPA	Scans the entire Link-Pack Area. This includes FLPA, MLPA, PLPA, EFLPA, EMLPA, and EPLPA.
MLPA	Scans the Modified Link-Pack Area (below the 16-megabyte line).
NUCLEUS	Scans the entire nucleus. This includes RWNUC, ROUNC, ERWNUC, and ERONUC.
PLPA	Scans the Pageable Link-Pack Area (below the 16-megabyte line).
PRIVATE	Scans private storage, both below and above the 16-megabyte line.
PSA	Scans the Prefixed Save Area.
PVT	Scans private storage below the 16-megabyte line.
RONUC	Scans the read-only nucleus below the 16-megabyte line.
RWNUC	Scans the read/write nucleus below the 16-megabyte line.
SQA	Scans the System Queue Area below the 16-megabyte line.

Examples

Example 1

AMTVSSI SEARCH STOPPED AT THE END OF THE AREA (7FFFFFFF)
```

Usage Notes

- You can omit previously typed parameters if you do not want to change them. For example, if you had previously typed **MEMSCAN TEXT PRIVATE** (which searches for the string TEXT in private storage), you can search for the string TEXT in common storage by typing **MEMSCAN,,COMMON**.
- The ATTENTION key interrupts MEMSCAN and saves all current values. The scan can be resumed at the point of interruption by typing **MEMSCAN REFIN**D or just **MEMSCAN**.
- Do not embed blanks in the search string.

MIO

The MIO service monitors the overall performance of the entire I/O subsystem, or a subset thereof, to detect I/O bottlenecks causing workload delays. This service provides workload (address space-related) information, which lets you detect jobs monopolizing specific devices and channel paths.

Syntax

where

- chpid*

Is a channel path identifier.
- chpid1-chpid2*

Is a range of channel path identifiers; *chpid1* is the lowest channel path identifier, and *chpid2* is the highest channel path identifier.
- time*

Specifies the length of the sample period in seconds. The default sample period is 15 seconds.
- Note:**

If you do not specify *chpid*, the MIO service monitors all channel paths attached to all processors.

Examples

To display information on all channel paths, type

```
mio

AMTO30I I/O DATA BEING GATHERED

```

Legend:

1. Channel path identifier (CHPID).
2. Type of channel path as specified during IOCP generation. The valid path types are BLOCK, for block multiplexing paths, and BYTE, for byte multiplexing paths.
3. Percentage of time that the channel path was busy during the sample period.

Note: Channel paths less than 1% busy during the sample period are not reported unless specified either explicitly or implicitly (using a path range) as an operand of the MIO service.
4. CPU identifier (CPUID) for the processor whose activity is being reported.
5. Total number of I/O interrupts (including TPIs) processed by this CPU in the sample period.
6. Percentage of I/O interrupts processed by this CPU that did not require a physical PSW swap (that is, were processed through the Test Pending Interrupt (TPI) instruction).
7. Device number whose activity was measured.

8. Volume serial number of the device measured.
 9. Percentage of time that an I/O request was active for the device.
 10. Average number of I/O requests queued by the I/O supervisor for the device.
- ❶ Total number of head movements observed for the device during the sample period (N/A for non-DASD and fixed-head devices).
 - ❷ Average number of cylinders moved for each seek observed for the device.
 - ❸ Number of I/O requests per second addressed to this device.
 - ❹ Average time (in milliseconds) that the device was connected to a channel path on a per-request basis.
 - ❺ Average time (in milliseconds) that each request was held, pending availability of a waiting for path, device, or control unit.
 - ❻ Average time (in milliseconds) that the device was disconnected from the channel path pending a device or control unit function (seek) on a per-request basis.
 - ❼ Name of an address space found to be a significant user of the device. In this field, ***** indicates that the address space terminated between the time that the data was collected and the time that the MDEVICE report was generated. *OTHERS* in this field indicates that the address space had more users during the sample period than could be listed. All activity for the overflow of users is reported as *OTHERS*.
 - ❽ Number of the address space found to be a significant user of the device.
 - ❾ Percentage of the device busy time that this address space was requesting the device.
 - ❿ Number of the logical control unit with which all the reported devices (back to the previous LCU report line) are associated.
- [1] Total number of I/O requests per second received for all devices associated with the LCU.
 - [2] Percentage of I/O requests processed by this LCU that were initiated successfully.
 - [3] Percentage of I/O requests processed by this LCU that were deferred because of a busy physical control unit.

- [4] Percentage of I/O requests processed by this LCU that were deferred because of a busy physical device.
- [5] Average number of I/O requests held (queued) by this LCU pending channel path, physical control unit, or device availability.

Usage Note

The MIO service uses a sampling technique for measuring I/O activity. The default sampling period is 15 seconds at a rate of four samples per second. If you enter an override value for *time*, the sample rate is four samples per second if the period is 15 seconds or less and two samples per second if the period is greater than 15 seconds.

MLCU

The MLCU (MLC) service monitors the performance and utilization of logical control units configured into the I/O subsystem. The service displays data (I/O rate, requests deferred for control unit, and device busy conditions) for logical control units that have I/O activity during the monitoring period.

Use this service to determine the optimal physical device placement and to evaluate shared DASD contention.

Syntax

where

<i>lcu</i>	Is a logical control unit.
<i>lcu1-lcu2</i>	Is a range of logical control units; <i>lcu1</i> is the lowest-numbered logical control unit, and <i>lcu2</i> is the highest-numbered logical control unit.
<i>time</i>	Specifies the length of the sample period in seconds. The default sample period is 15 seconds.

Example 1 (for Processors Older Than 3090)

To monitor all LCUs for 15 seconds, type

mlcu

AMTO40I LOGICAL CONTROL UNIT DATA BEING GATHERED

AMTO41I LOGICAL CONTROL UNIT ACTIVITY REPORT

	①	②	③		④	⑤		⑥
AMTO39I LCU 03:	I/O RATE	5/SEC	%OK 87	%DEFER	2/ 11		AQD	1
AMTO39I LCU 07:	I/O RATE	3/SEC	%OK 93	%DEFER	5/ 2		AQD	1
AMTO39I LCU 1A:	I/O RATE	23/SEC	%OK 81	%DEFER	9/ 10		AQD	3
AMTO39I LCU 21:	I/O RATE	48/SEC	%OK 44	%DEFER	39/ 17		AQD	5
AMTO39I LCU 2F:	I/O RATE	9/SEC	%OK 73	%DEFER	14/ 13		AQD	2

Legend:

1. Logical control unit number.
2. Total number of I/O requests/second received for devices associated with the LCU.
3. Percentage of I/O requests processed by this LCU that were initiated successfully.
4. Percentage of I/O requests deferred because of a busy physical control unit.
5. Percentage of I/O requests processed by this LCU that were deferred because of a physical device busy condition.
6. Average number of I/O requests that were held (queued) by this LCU pending channel path, physical control unit, or device availability.

Example 2 (for Processors Older Than 3090)

To monitor LCUs from 0 to 2E for five seconds, type

```
mlcu 000-02E 5
```

```
AMTO40I LOGICAL CONTROL UNIT DATA BEING GATHERED
```

```
AMTO41I LOGICAL CONTROL UNIT ACTIVITY REPORT
```

```
AMTO63I IOP 00:  ACTIVITY RATE  512   AVG Q LENGTH  .02
AMTO63I IOP 01:  ACTIVITY RATE  .00   AVG Q LENGTH  .00
AMTO61I LCU 0013 CONTENTION RATE    2   ALL PATHS BUSY  0  %SWITCH BUSY  0
AMTO62I LCU 0013 DELAY Q LENGTH    .66  CHPID TAKEN    1  %CU BUSY   37
AMTO61I LCU 001A CONTENTION RATE    .00  ALL PATHS BUSY  0  %SWITCH BUSY  0
AMTO62I LCU 001A DELAY Q LENGTH    .00  CHPID TAKEN   .60  %CU BUSY    0
AMTO61I LCU 001D CONTENTION RATE    .00  ALL PATHS BUSY 20  %SWITCH BUSY  0
AMTO62I LCU 001D DELAY Q LENGTH    .00  CHPID TAKEN   21  %CU BUSY    0
AMTO61I LCU 0024 CONTENTION RATE    .00  ALL PATHS BUSY  0  %SWITCH BUSY  0
AMTO62I LCU 0024 DELAY Q LENGTH    .00  CHPID TAKEN   59  %CU BUSY    0
AMTO61I LCU 0029 CONTENTION RATE    .00  ALL PATHS BUSY  0  %SWITCH BUSY  3
AMTO62I LCU 0029 DELAY Q LENGTH    .00  CHPID TAKEN  111  %CU BUSY    2
AMTO61I LCU 002E CONTENTION RATE    .00  ALL PATHS BUSY  0  %SWITCH BUSY  0
AMTO62I LCU 002E DELAY Q LENGTH    .00  CHPID TAKEN  129  %CU BUSY    0
```

Example 3 (for 3090 and Newer Processors)

To monitor all LCUs for 15 seconds, type

```
mlcu
```

```
AMTO40I LOGICAL CONTROL UNIT DATA BEING GATHERED
```

```
AMTO41I LOGICAL CONTROL UNIT ACTIVITY REPORT
```

```

          ①                               ②
AMTO63I IOP 01:  ACTIVITY RATE 0000  AVG Q LENGTH 0000
          ③                               ④
AMTO61I LCU 023: CONTENTION RATE 0005  ALL PATHS BUSY 0001
          ⑤                               ⑥                               ⑦
AMTO62I LCU 023: DELAY Q LENGTH 0000  CHPID TAKEN 0000  % CU BUSY 0000
```

Legend:

1. Total number of I/O requests per second received for all devices associated with the LCU.

2. Average depth of the I/O request queue.
3. Rate at which I/Os were queued on the LCU in the I/O subsystem.
4. Percentage of time that all paths to a given I/O device on that LCU were busy.
5. Average length of the queue for the LCU.
6. Percentage of I/O requests processed by this LCU that were initiated successfully.
7. Percentage of I/O requests processed by this LCU that were deferred because of a busy physical control unit.

Usage Note

The MLCU service uses a sampling technique for measuring I/O activity. The default sampling period is 15 seconds at a rate of four samples per second. If you enter an override value for time, the sample rate is four samples per second if the period is 15 seconds or less and two samples per second if the period is greater than 15 seconds.

MONITOR

The MONITOR (MON) service monitors address space activity to determine whether an address space is in a wait or a looping state. The service provides the basis for a deadline management system by providing CPU time and EXCP counts for the life of a step. For a job whose characteristics are known, you can gauge the progress of a step at any point during its execution.

Syntax

where

<i>aname</i>	Is the address space name.
<i>(asid)</i>	Is the address space identifier in decimal format.
<i>(Xasid)</i>	Is the address space identifier in hexadecimal format.
<i>@</i>	Specifies your own address space.
<i>*</i>	Specifies the last address space entered.
<i>seconds</i>	Is the number of seconds the address space is to be monitored; the default is 30 seconds.

Example

To monitor address space INVENTORY for 30 seconds, type

monitor inventory

AMTJ22I STATISTICS BEING GATHERED FOR INVENTORY

	①	②	③	④	⑤	⑥			
AMTJ21I	JOB	295	INVENTORY	STEP1	PRTY	EE(238)	PGP	22/2	
AMTJ23I	LIFE OF	STEP	TOTAL	CPU	26.33	EXCP	1233	PAGES	8 SUN 10300
				⑦		⑧		⑨	⑩
AMTJ24I	LAST	30	SECOND	CPU	3.95	EXCP	70	PAGES	0 SUN 500

Legend:

1. JES job ID.
2. Address space name.
3. Current stepname.
4. Priority.
5. Performance group.
6. Performance period.
7. CPU time for the life of the step during the time specified.
8. Count of EXCPs for the life of the step during the time specified.
9. Total number of page actions during the step during the time specified.
10. Total service units for the step during the time specified.

MOUNT

The MOUNT (MOU) service mounts all online direct access storage devices that are not allocated or mounted as public or storage volumes. This service also provides a shorthand method for issuing mount commands for removable disk devices, as opposed to issuing the OS/390 MOUNT command for each volume.

Syntax

▶—MOUNT —▶

Example

To mount all online direct access storage devices, type

```
mount
      ①           ②           ③           ④
AMTM11I  PACK01 MOUNTED ON 23A (PRIVATE/RESERVED)
      ⑤
AMTM12I  1 DIRECT ACCESS VOLUME(S) MOUNTED
```

Legend:

1. Volume serial of the disk device mounted.
2. Device number.
3. Volume-use attribute (PRIVATE/PUBLIC/STORAGE).
4. Volume-mount attribute (RESERVED/RESIDENT).
5. Number of devices whose mount or use attributes were changed by service MOUNT. If no devices were affected, this field contains a 0 (zero).

Usage Notes

- The MOUNT service affects every online DASD (Direct Access Storage Device) that
 - is not currently allocated
 - is not in the process of being taken offline
 - does not contain an active page data set
 - is not already marked either RESIDENT or RESERVED
- The MOUNT service marks all DASD except those marked PUBLIC and REMOVABLE as mounted in the UCB (that is, with mount status =RESERVED). It does not do physical I/O to the pack and does not fill in volume serial information in the UCB.

MPATH

The MPATH (MPA) service monitors I/O channel path activity. This service also detects imbalances and possible path failures by monitoring the utilization of all, or a subset of, the channel paths installed in the system.

Syntax

where

- chpid*

Is a channel path identifier.
- chpid1-chpid2*

Is a range of channel path identifiers; *chpid1* is the lowest channel path identifier, and *chpid2* is the highest channel path identifier.
- time*

Specifies the length of the sample period in seconds. The default sample period is 15 seconds.
- Note:**

If you do not specify *chpid*, the MPATH service monitors all channel paths attached to all processors.

Example

To display I/O activity for all channel paths, type

mpath					
					②
AMTO21I	CHANNEL	PATH	0C	WAS	4% BUSY
AMTO21I	CHANNEL	PATH	12	WAS	1% BUSY
AMTO21I	CHANNEL	PATH	13	WAS	1% BUSY
AMTO21I	CHANNEL	PATH	1B	WAS	13% BUSY
AMTO21I	CHANNEL	PATH	1C	WAS	7% BUSY
AMTO21I	CHANNEL	PATH	38	WAS	14% BUSY
AMTO21I	CHANNEL	PATH	39	WAS	19% BUSY
AMTO21I	CHANNEL	PATH	3C	WAS	19% BUSY
AMTO21I	CHANNEL	PATH	3D	WAS	11% BUSY

To display I/O activity for channel paths 12–14, type

mpath 12-14

	①	②
AMTO21I CHANNEL PATH 12 WAS		4% BUSY
AMTO21I CHANNEL PATH 13 WAS		3% BUSY
AMTO21I CHANNEL PATH 14 WAS		0% BUSY

To display I/O activity for all channel paths over the past 60 seconds, type

mpa , , 60

	①	②
AMTO21I CHANNEL PATH 0C WAS		4% BUSY
AMTO21I CHANNEL PATH 12 WAS		3% BUSY
AMTO21I CHANNEL PATH 13 WAS		3% BUSY
AMTO21I CHANNEL PATH 14 WAS		4% BUSY
AMTO21I CHANNEL PATH 1B WAS		5% BUSY
AMTO21I CHANNEL PATH 1C WAS		5% BUSY
AMTO21I CHANNEL PATH 1E WAS		4% BUSY
AMTO21I CHANNEL PATH 38 WAS		5% BUSY
AMTO21I CHANNEL PATH 39 WAS		11% BUSY
AMTO21I CHANNEL PATH 3C WAS		11% BUSY
AMTO21I CHANNEL PATH 3D WA		6% BUSY

Legend:

1. Channel path identifier (CHPID).
2. Percentage of time that the channel path was busy during the sample period.

Usage Note

The MPATH service uses a sampling technique for measuring I/O activity. The default sampling period is 15 seconds at a rate of 10 samples per second. If you enter an override value for time, the sample rate is 10 samples per second if the period is 15 seconds or less and five samples per second if the period is greater than 15 seconds.

Syntax

Example

To display the virtual storage areas for BMVDWP3, type

AMTMS0I Address space: BMVDWP3 ①							
	②	③ START	④ END	⑤ LENGTH (K)	⑥ %USED	⑦ USER	LMT
AMTMS1I	AREA						
AMTMS2I	-----	-----	-----				
AMTMS3I	Ext LSQA/SWA	7F6C8000	7FFFFFFF	9,440K	99		
AMTMS3I	Uncommitted Ext-Pvt	11A8A000	7F6C7FFF	1,798,392K	---	139FFFFFF	
AMTMS3I	Committed Ext-Pvt	11A00000	11A89FFF	552K	77		
AMTMS3I	Ext CSA	051D0000	119FFFFFF	204,992K	28		
AMTMS3I	Ext MLPA	051BA000	051CFFFF	88K	---		
AMTMS3I	Ext FLPA	051B7000	051B9FFF	12K	---		
AMTMS3I	Ext PLPA	0271A000	051B6FFF	43,636K	---		
AMTMS3I	Ext SQA	01898000	02719FFF	14,856K	82		
AMTMS3I	Ext NUC R/W	01596000	01897FFF	3,080K	---

AMTMS3I	SQA	00EBA000	00FC8FFF	1,084K	50		
AMTMS3I	PLPA	00C0D000	00EB9FFF	2,740K	---		
AMTMS3I	MLPA	00B8A000	00C0CFFF	524K	---		
AMTMS3I	CSA	00800000	00B89FFF	3,624K	93		
AMTMS3I	LSQA/SWA	0075A000	007FFFFFF	664K	54		
AMTMS3I	Uncommitted Private	0005F000	00759FFF	7,148K	---	00414FFF	
AMTMS3I	Committed Private	00005000	0005EFFF	360K	104		
AMTMS3I	V=R (IF ANY)	00005000	00024FFF	128K	---		
AMTMS3I	System						

Legend:

1. Name of the address space.
2. Name of the virtual storage area.
3. Lowest virtual storage address for this storage area.
4. Highest virtual storage address for this storage area.
5. Number of kilobytes contained in this storage area.
6. Percent of the area in use, where available.
7. Region limit value.

MTP

The MTP service

- displays volume serial numbers, device numbers, device types, and address space names for tape and direct access storage devices that have pending mount requests
- identifies the source of the malfunction when an address space stops processing
- finds out which address space requests a particular volume

Syntax

►—MTP —◄

Example

To identify pending mount requests, type

mtp

```

AMTM22I      MOUNT PENDING FOR B90078 UNIT= 384 (3400-4) JOB= GJJ$RUN

```

Legend:

1. Volume serial number of the requested volume.
2. Number of the device that requires the volume mount.
3. Device type.
4. Name of the address space requesting the unmounted volume.

Note: Only the volume serial number requested by the allocation appears in message AMTM22I. The second and successive volumes of a data set appear as blanks in message AMTM22I.

NUCLEUS

The NUCLEUS (NUC) service displays the entry point address and addressing mode of a nucleus CSECT or entry point. This service also locates a given CSECT within the system nucleus or determines whether an address is within the extent of a nucleus CSECT.

Syntax

where

<i>entry name</i>	Is the nucleus CSECT name.
<i>hex location</i>	Is the address within the nucleus.
LOC	Indicates the first parameter entry is an address and not an entry name; the LOC keyword must follow the hex location.

Examples

To display the entry point address and addressing mode for entry name IECROUTE, type

```
nucleus iecroute  
①  
AMTN11I ENTRY=IECROUTE  
AMTN13I EPA=01224000 (AMODE=31) LTH=000780  
②          ③          ④
```

Legend:

1. Requested CSECT or entry name.
2. Address in the system nucleus of the CSECT or entry point.
3. Addressing mode of the CSECT or entry point.
4. Length of the module.

To display the entry-point address for hex location 01224018, type

```
nucleus 1224018 loc
           ①           ②           ③
AMTN12I LOC 01224018 IS + 000018 FROM ENTRY IECROUTE
AMTN13I EPA=01224000 (AMODE-31) LTH=000780
```

Legend:

1. Requested hex location.
2. Hexadecimal offset of the hex location from the nucleus entry point that contains the hex location.
3. Name of the closest nucleus entry point to the requested hex location.

OKSWAP

The OKSWAP (OKS) service reverses the effects of the DONTSWAP service, making an address space swappable.

Syntax

where

@	Specifies your own address space.
<i>asname</i>	Is the address space name.
<i>(asid)</i>	Is the address space identifier in decimal format.
<i>(Xasid)</i>	Is the address space identifier in hexadecimal format.
*	Specifies the last address space entered.

Note: If you do not specify an address space to be made swappable, you are prompted to define an address space.

Examples

To make address space INVENTORY swappable, type

```
okswap inventory
AMTS61I   STC 6 INVENTORY STEP3 PRTY 7(116) PGP 2/3
AMTS62I   INVENTORY HAS BEEN SET SWAPPABLE (00)
```

To reduce the nonswappability count of address space INVENTORY, type

okswap inventory

		①		②		③
AMTS61I	STC 6	INVENTORY	STEP3	PRTY 7(116)	PGP 2/3	
						④
AMTS64I	INVENTORY	NONSWAPPABILITY	COUNT	REDUCED	(02)	

Legend:

1. JES job ID, address space name, and current stepname of the specified address space.
2. External and internal dispatching priority of the address space.
3. Performance group and performance group period.
4. Nonswappability count. The operating system keeps this count for the address space. If the count is greater than zero, the address space is still nonswappable. The OKSWAP service reduces the count by one. When the count reaches zero, the address space is swappable.

Usage Note

The OKSWAP service reverses the effects of the DONTSWAP service. Using the OKSWAP service to make system-specified nonswappable address spaces swappable is not recommended.

PAGING

The PAGING (PAG) service is the paging monitor for the OS/390 system. This service provides the total paging rate and divides the total paging rate into its components for analysis. It also provides the page reclaim rate.

Syntax

▶▶PAGIN◀◀

Example

To display paging information, type

paging		①	②
AMTP11I	TOTAL PAGING RATE	26.75 PAGES/SEC	FOR LAST 65.25 SECONDS
AMTP12I	DEMAND PAGING	10.05 PAGES/SEC	
		③	
AMTP13I	VIO PAGING RATE	3.60 PAGES/SEC	
		④	
AMTP14I	SWAP PAGING RATE	9.75 PAGES/SEC	
		⑤	
AMTP15I	LPA PAGING RATE	3.79 PAGES/SEC	
		⑥	
AMTP16I	CSA PAGING RATE	6.44 PAGES/SEC	
		⑦	
AMTP17I	PAGE RECLAIM RATE	2.50 PAGES/SEC	

Legend:

- 1. Total system paging rate over the last data collection interval; total system paging is the sum of VIO paging operations (in and out), swapping operations, and all other paging operations (excluding CSA paging and page reclaims).
- 2. Duration of the last data collection interval.
- 3. Paging rate caused by virtual I/O.
- 4. Paging rate caused by swapping.

5. Paging rate in the system link-pack area (LPA).
6. Paging rate in the common service area (CSA).
7. Page reclaim rate.

Usage Note

The period for which paging data is reported can vary, based on the time the paging activity counters were last cleared.

PARMLIST

The PARMLIST (PAR, PLIST, or PL) service lists the contents of SYS1.PARMLIB members. This service helps you examine system initialization and operation parameters.

Syntax

▶▶—PARMLIST —*member*————▶▶

where

member Is a member in SYS1.PARMLIB.

Example

To list the contents of SYS1.PARMLIB member IEASYS00, type

parmlist ieasys00

```
AMTCF1I  APF=00 ,
AMTCF1I  CMD=00 ,
AMTCF1I  CSA=3072 ,
AMTCF1I  CVIO ,
AMTCF1I  FIX=00 ,
AMTCF1I  ICS=00 ,
AMTCF1I  IOS=00 ,
AMTCF1I  IPS=00 ,
AMTCF1I  LNK=00 ,
AMTCF1I  MLPA=( 00 ) ,
AMTCF1I  LOGCLS=L ,
AMTCF1I  LOGLMT=050000 ,
AMTCF1I  MAXUSER=50 ,
AMTCF1I  OPT=00 ,
AMTCF1I  PAGE=( SYS1 . PAGEA ,
AMTCF1I           SYS1 . LOCALA ,
AMTCF1I           SYS1 . LOCALB ,
AMTCF1I           SYS1 . LOCALC ,
AMTCF1I           SYS1 . LOCALD ) ,
AMTCF1I  PAGNUM=( 4 , 3 ) ,
AMTCF1I  REAL=192 ,
```

```
AMTCF1I  RSU=2 ,
AMTCF1I  SMF=00 ,
AMTCF1I  SQA=8 ,
AMTCF1I  SWAP=( SYS1 . SWAPA
AMTCF1I           SYS1 . SWAPB ) ,
AMTCF1I  VAL=00 ,
AMTCF1I  VRREGN=192 ,
```

PIO

The PIO (PI) service monitors I/O interrupt activity and determines the distribution of I/O interrupts among processors.

Syntax

where

time Specifies the length of the sample period in seconds. The default sample period is 15 seconds.

Example

To display I/O interrupt activity, type

pio

AMT070I I/O INTERRUPT DATA BEING GATHERED

AMT073I PROCESSOR I/O INTERRUPT ACTIVITY REPORT

	①	②	③
AMT074I CPU 00 PROCESSED		300 INTERRUPTS (2% WERE THROUGH TPI)
AMT074I CPU 02 PROCESSED		1387 INTERRUPTS (11% WERE THROUGH TPI)

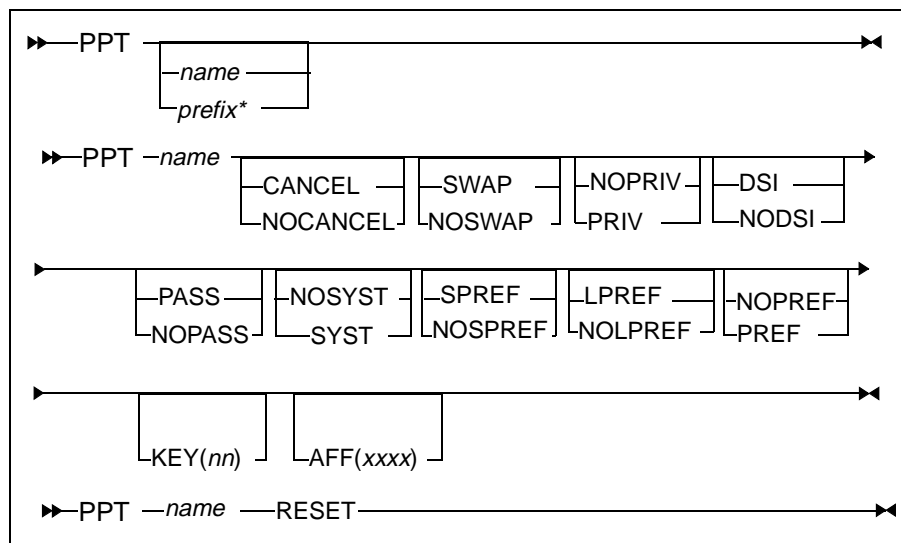

Legend:

1. CPU identifier (CPUID) for the processor whose activity is being reported.
2. Total number of I/O interrupts (including TPIs) processed by this CPU in the interval.
3. Percentage of I/O interrupts processed by this CPU through the Test Pending Interrupt (TPI) instruction—the percentage of I/O interrupts that do not require a physical program status word (PSW) swap.

PPT

The PPT service displays and updates the program properties table (PPT).

Syntax

Description

The PPT service is used to

- display the entire program properties table (PPT)
- display the PPT entry for all programs that begin with a string of one or more characters
- display the PPT entry for a specific program
- functionally delete a PPT entry (remove all special attributes)
- add or change PPT entries; the presence of one or more keywords in addition to the program name indicates the following:
 - A new entry will be created, if one does not currently exist.
 - If an entry exists, it should be updated according to the keywords that were specified. Only the specified attributes are changed.

The following table lists the supported bimodal keywords. The first column represents the IBM default value, and the second column represents the opposite meaning from the value in the first column. If neither keyword in a row is specified, the existing value is retained.

When a new entry is created, all attributes are set to the values in the first column prior to applying the specified keywords. Keywords that begin with NO can be abbreviated to their first five characters. Other keywords can be abbreviated to their first three characters.

Column 1 (IBM default value)	Column 2 (Opposite meaning)
CANCEL	NOCANCEL
SWAP	NOSWAP
NOPRIV	PRIV
DSI	NODSI
PASS	NOPASS
NOSYSTAS	SYTASK
NOLPREF or NO1P	LPREF or 1P
NOSPREF or NO2P	SPREF or 2P
PREF	NOPREF

Other keyword parameters are

Keyword	Description
KEY(<i>nn</i>)	Value of <i>nn</i> is 0-15. (The default is 8.)
AFF(<i>xxxx</i>)	Value of <i>xxxx</i> is a four-character hexadecimal mask representing the processors upon which the program can execute. The default is AFF(FFFF). CPU is an alias for AFF.
RESET	Indicates that all IBM defaults are to be applied to the entry (all special attributes removed). RESET cannot be specified in conjunction with any other keyword.

Enter	To
ppt	Display all entries in the PPT.
ppt, <i>prefix</i> *	Display all PPT entries that begin with the <i>prefix</i> .
ppt, <i>name</i>	Display the PPT entry for a program <i>name</i> .
ppt, <i>name</i> ,reset	Reset all of the attributes in the PPT entry for the program <i>name</i> to the IBM defaults, which effectively deletes the entry.
ppt, <i>name</i> ,attr1,attr2,...attrn	Create a PPT entry for the program <i>name</i> , if one does not already exist, and set the specified attributes. Unspecified attributes remain as currently defined. For example: PPT name, NOSWAP,CANCEL would add the NOSWAP attribute, remove the NOCANCEL attribute, and leave all others unchanged.
ppt, <i>name</i> ,AFF(<i>xxx</i>)	Set the CPU affinity mask for the PPT entry for program <i>name</i> . You must specify all four hexadecimal characters in the mask.

Example 1

To display all the PPT entries, type

ppt

Note: If DWPTEST does not currently exist, it is created.

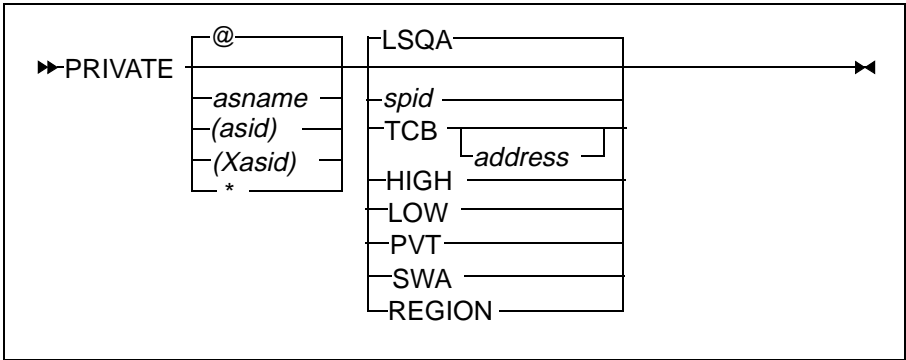

PRIVATE

The PRIVATE (PRI or PVT) service summarizes virtual storage allocations for private storage in an address space and displays an overview of subpool allocations within a private address space.

Use the PRIVATE service to

- display allocated storage and fragmented free space by subpool and key
- debug applications that use excessive private storage
- tune virtual storage-constrained systems
- monitor virtual storage use within an address space

Syntax

where

@	Specifies your own address space; the default.
asname	Is the address space name.
(asid)	Is the address space identifier in decimal format.
(Xasid)	Is the address space identifier in hexadecimal format.
*	Specifies the last address space entered.
LSQA	Displays a detailed report of allocations in the Local System Queue Area, which consists of subpools 205, 215, 225, 236, and 255; the default.
spid	Is a three-digit decimal subpool identifier in the range between 0 and 255.
TCB	Displays a summary of the storage allocated by all tasks in the address space.

<i>address</i>	Is the address of the TCB for which you want to display a detailed report of storage allocations.
HIGH	Displays a summary of subpools located in private high storage.
LOW	Displays a summary of subpools located in private low storage.
PVT	Displays a summary of subpools 0–127, 129–132, 229, 230, 236, 237, 251, and 252.
SWA	Displays a detailed report of allocations in the Scheduler Work Area, which consists of subpools 237 and 238.
REGION	Lists regions for the specified address space.

Examples

To determine LSQA usage for address space INVENTORY, type

private inventory											
	①	②									
AMTPR8I	SUMMARY OF LSQA	STORAGE FOR INVENTORY BY SUBPOOL									
AMTPR9I	SP ,TYPE/KEY	0	1	2	3	4	5	6	7	8-F	TOTAL

```

PROGRESS

The PROGRESS (PRO) service displays the status and current step information for a specified address space. It also displays how the number of steps in a job is reached. This service lets you determine how long an address space or step has been running.

Syntax

where

- | | |
|----------------|--|
| <i>asname</i> | Is the address space name. |
| <i>(asid)</i> | Is the address space identifier in decimal format. |
| <i>(Xasid)</i> | Is the address space identifier in hexadecimal format. |
| @ | Specifies your own address space. |
| * | Specifies the last address space entered. |

Example

To display the progress of jobs in address space INVENTORY, type

progress inventory									
	①		②		③		④		
AMTP90I	JOB	965	INVENTORY	IEFPROC	PRTY	E0 (224)	PGP	1/1	
AMTP93I	MSGCLASS	:	A			MSGLEVEL	:	(2,0)	⑤
AMTP97I	PROGRAM	:	DFSMVRC0			PGMR NAME	:	**BOOLE**	⑥
AMTP91I	JOB START DATE	:	90058						
AMTP92I	ADDR SPACE START	:	17:02:44			JOB CLASS	:	P	⑦
AMTP94I	STEP START	:	17:02:44			STEP NO.	:	1/ 2	⑧
AMTP95I	STEP TCB TIME	:	19.36			SRB TIME	:	2.23	⑨
AMTP9BI	STEP TOTAL CPU	:	21.59			CPU LIMIT	:	1800.40 1%	⑩
AMTP96I	REGION REQUESTED	:	2048K			EXTENDED	:	572K	❶
AMTP9CI	CURRENT USE <16M	:	552K			EXTENDED	:	8K	❷
AMTP9DI	MAX USED <16M	:	2.058M			EXTENDED	:	10.08M	❸

Legend:

1. JES job ID of the specified address space.
2. Address space name (*asname*) and current stepname.
3. Address space dispatching priority.
4. Performance group and period.
5. Job message class and allocation and termination message levels.
6. Name of the program that was given control when the current step began execution, and the programmer name from the job JCL statement.
7. Time of day that the address space was initiated, and the initiation job class.
8. Time of day that the current step began execution, the current step number, and the total number of steps in the job.
9. Amount of CPU time, in seconds, used by the step in TCB mode, and the amount of CPU time, in seconds, used by the step in SRB mode.
10. Total amount of CPU time, in seconds, used by the current step, the amount of CPU time, in seconds, allotted to the current step, and the percentage of allocated CPU time that has been used.

- ❶ Amount of virtual storage (in 1024-byte increments) requested by the current step, and the amount above the 16 MB line used by the current step.
- ❷ Amount of virtual storage below the 16 MB line currently in use, and the amount above the 16 MB line currently in use.
- ❸ Highest amount of virtual storage below the 16 MB line used by the current step, and the highest amount above the 16 MB line used by the current step.

Examples

To display CPU busy percentage and processor usage when running under the IBM PR/SM complex, type

prsm

AMTLO1I Collecting statistics for 10 Seconds

AMTLPBI Plex busy: 98.1%

AMTLPBI Plex overhead: 1.1%

AMTLP1I

AMTLP1I

	④	⑤	⑥
AMTLP7I	Current	CPU	
AMTLP8I	Partition	ID	% Busy
AMTLP9I	-----	---	-----
AMTLP10I	SYSC	0	47.0
AMTLP11I		1	47.5
AMTLP12I		2	0.0
AMTLP13I			

Legend:

1. Number of partitions that have been defined on this PR/SM complex.
2. Number of physical CPUs in the PR/SM complex.
3. Number of milliseconds that a virtual processor will get control during a dispatch interval.
4. Name assigned to the logical partition.
5. Status of the logical partition. ACT means that the partition is active. INACT means that the partition has been defined but is not being used.

6. YES indicates that wait assist is available. NO indicates that wait assist is *not* available.
7. Weight that the dispatcher for PR/SM will give to this logical partition.
8. Partition's weight divided by the sum of the weights for all partitions in the plex.
9. Number of logical CPUs that will run in this logical partition.
10. Average logical CPU use that this logical partition is making of the processor complex.
- ❶ Average physical CPU use that this logical partition is making of the processor complex.
- ❷ Percentage of time that partitions were dispatched.
- ❸ Percentage of time used for dispatching partitions that could otherwise be attributed to a partition.
- ❹ Name of the logical partition on which the service is running.
- ❺ IDs of the logical CPUs in the current partition.
- ❻ Percentage of time that each processor in the current partition was busy.

To display information on individual domain activity when running under an MDF environment, type

prsm

AMTDP7I Statistics being gathered for MDF data

AMTDP1I

			①	②				
AMTDP2I	Current Domain: PRODMVS			Number: 2				
AMTDP1I								
	③	④	⑤	⑥	⑦	⑧	⑨	⑩
AMTDP3I	Domain	Domain	Min	Tgt	Max	CPU	Int	Sched
AMTDP4I	Name	Number	Alloc	alloc	alloc	Norm	Util	Parm
AMTDP5I	-----	-----	-----	-----	-----	-----	-----	-----
AMTDP6I	PRODVM	1	10	35	45	37.5	29.8	2
AMTDP6I	PRODMVS	2	10	35	45	44.7	43.2	2
AMTDP6I	TESTVM	3	1	5	10	4.6	3.7	5
AMTDP6I	TESTMVS	4	1	5	10	1.2	.8	5
AMTDP1I								

Legend:

1. Name assigned to the current domain.
2. Number of the current domain.
3. Name assigned to each domain.
4. Number of each domain.
5. Value set by operator for the minimum CPU allocation for the domain.
6. Value set by operator for the target CPU allocation for the domain.
7. Value set by operator for the maximum CPU allocation for the domain.
8. Actual CPU allocation for the domain.
9. **Internal Utilization** field.

The internal CPU utilization provided by the macrocode is based upon the status (busy or wait) of the processor when the allotted time of a domain ends. It is not a measure of the status during the allotted time. Because of this fact, the internal CPU utilization information display

- more precisely represents utilization *relative to* the other domains active during the period
- is most precise when the CPUs are closer to 100% busy and least accurate (understated) when the CPUs are only 50% busy
- is more precise on 5990 model CPUs where the allotted times are shorter (and more frequent) than on 58xx model CPUs

On Amdahl 580 or 5890 model CPUs, the source for the **Internal Utilization** field is not provided or updated by the macrocode, unless

- the FE service key is turned on
- an Amdahl macrocode patch is applied (see your Amdahl service representative)

If the FE service is not on or the macrocode patch is not applied, N/A is displayed in the **Internal Utilization** field.

10. Scheduling parameter for the domains, supplied by operator on the service console.

Syntax

Note: If you type REPLIES without parameters, only messages from the current system are displayed.

Example 1

To display outstanding replies from the current system, type

rep

AMTR17I			TERMINATE, REPLY 'STOP', 'STOPQ', OR 'STOPS'

Legend:

1. Name or ID of the system where the replies were issued.
2. JES job ID, including the job number and type (JOB for batch job, STC for started task, and TSU for time-sharing user).
3. Reply number.
4. Reply text.

RESERVES

The RESERVES (RES) service

- helps determine the cause of poor DASD performance or system lockouts
- displays reserve activity for DASD devices
- displays system contention caused by long-term reserves

A reserve issued by one processor for a single resource prevents all other processors from accessing the entire volume.

Syntax

»——RESERVES——«

Example

To display reserve activity on DASD devices, type

reserves

	①	②	③	④														
AMTQ1PI	SYSTEM	(LOCAL)	Q=SYSZVVDS	R=CATALOG.ICFMCAT.SYSC														
AMTQ1QI	SYSID	JOBNAME	ASID	STAT	TYP	TIME	14:12:19											
AMTQ1RI	SYSB	QA7A	(0087)	OWNS	EXC													
AMTQ1RI	SYSA	FLN1	(0096)	WAIT	EXC													
AMTQ1RI	SYSB	QA7	(0352)	WAIT	EXC													
AMTQ1LI																		
AMTQ1PI	SYSTEM	(LOCAL)	Q=SYSIGGV2	R=ICFUCAT.VTSG304														
AMTQ1QI	SYSID	JOBNAME	ASID	STAT	TYP	TIME	14:12:19											
	⑤	⑥	⑦	⑧	⑨	⑩		①	②	③	④							
AMTQ1RI	SYSC	MPP1	(0121)	OWNS	SHR	RES=003	PEND	291	TSG304	NR								
AMTQ1RI	SYSC	MPP1	(0121)	OWNS	SHR	CVT												
AMTQ1RI	SYSB	ARG1	(0162)	WAIT	EXC													

Legend:

1. Scope of enqueue. The possible scopes are as follows:
 - SYSTEMS
 - SYSTEM
 - STEP
2. Whether the resource is global or local.
3. Major name (Q=).
4. Minor name (R=).
5. System ID for the system executing the task that is holding or waiting for the resource.
6. Jobname, TSO user ID, or started-task ID for the address space containing the task that is holding or waiting for the resource. The jobname is not available in some situations.
7. ID for the address space holding or waiting for the resource.
8. Current status (OWNS or WAIT), indicating that the task holds (OWNS) the resource or is waiting (WAIT) for the resource.
9. Type of enqueue: EXC for exclusive, SHR for shared.
10. RES indicates that a reserve is associated with the enqueue. The reserve count is also displayed unless it is zero, in which case the equal sign is also omitted.

CVT indicates that reserve request has been converted to global enqueue. The remaining four fields may not appear.

- ❶ If present, indicates that the reserve is pending, which means that the task is waiting to reserve the devices. Generally, the device is reserved by another system.
- ❷ Device address in hexadecimal format.
- ❸ Volume serial number.
- ❹ If present, indicates that the device is not ready.

RSM

The RSM service provides information on the allocation of real storage within the system. This service also determines the number of pageable and fixed real-storage frames allocated to system common storage areas (LPA, CSA), the system queue area (SQA), and private storage. You can also display the number of frames allocated to each address space.

You can use this information to observe the

- effects of real-storage page fixing
- usage of real-storage frames residing above the 16 MB line
- impact of specific workloads on the real-storage resource

Syntax

where

MAP	Provides a tabular display of the amount of real storage allocated to each address space.
ASID	Sorts the output in ascending order by address space identifier.
NAME	Sorts the output in alphabetical order by address space name or system area.
FRAMES	Sorts the output in descending order by the total number of frames allocated to the address space or system area. Only the address spaces with the 10 highest numbers of allocated frames are displayed.
FIXED	Sorts the output in descending order by the total number of frames allocated to the address space or system area that are marked as fixed. Only the address spaces with the 10 highest numbers of allocated fixed frames are displayed.

<16MB	Sorts the output in descending order by the number of frames allocated to the address space or system area that are currently marked as fixed below the 16 MB line. Only the address spaces with the 10 highest number of fixed frames below the 16 MB line are displayed.
LSQA	Sorts the output in descending order by the total number of frames allocated to the local system queue area for the listed address space. Only the address spaces with the 10 highest number of frames allocated to the local system queue area are displayed.
WSS	Sorts the output in descending order by the working set size of the address space at the time of the last swap-out. Only the address spaces with the 10 largest working set sizes are displayed.
PERCENT	Sorts the output in descending order by the percentage of online real-storage frames allocated to the address space. Only the address spaces with the 10 highest percentages of online real-storage frame allocations are displayed.

Examples

To display real-storage allocation, type

rsm

AMTRS0I	TOTAL	FIXED	
	①	②	
AMTRS1I PRIVATE FRAMES:	13975	4589	
	③	④

Legend:

1. Total frames allocated to private areas.
 2. Fixed frames allocated to private areas.
 3. Total RCECOMAL-SQA frames allocated to common areas (LPA+CSA).
 4. Fixed frames allocated to common areas (CSA+LPA).
 5. Frames allocated to SQA (source: OS/390 RSM).
 6. Always same as SQA total.
 7. Total free frames (calculation: RCEAFC).
 8. Always zero.
 9. Number of frames currently online (calculation: RCEPOOL is equal to the total of the fields in the column).
 10. Total fixed frames allocated in system (calculation: RCETOTFX is equal to the total of the fields in the column).
-
- ❶ Frames allocated to system nucleus.
 - ❷ Same as nucleus total.
 - ❸ Frames allocated to hardware storage area (HSA).
 - ❹ Always zero.
 - ❺ Frames unaccounted for (bad, offline).
 - ❻ Total storage on the machine.
- Total number of fixed frames.

To display the amount of real storage allocated to each address space, type

AMTR26I	LPA	****	643	58	----	----	----	11
AMTR26I	NUCLEUS	****	374	374	----	----	----	6
AMTR26I	SQA	****	359	359	----	----	----	6

Legend:

1. The name of the address space or system area whose frame counts are being provided. The first entry (flagged as *FREE*) contains a count of the number of unallocated frames in the system.

The system queue area (SQA), link-pack area (LPA), and common storage area (CSA) table entries follow the FREE entry. The system area entries are followed by the entries for the system address spaces (*MASTER*, PCAUTH, and so on) that are established during system initialization.

Entries for each additional address space in the system are then listed (in ASID order). The last table entry describes the system nucleus.

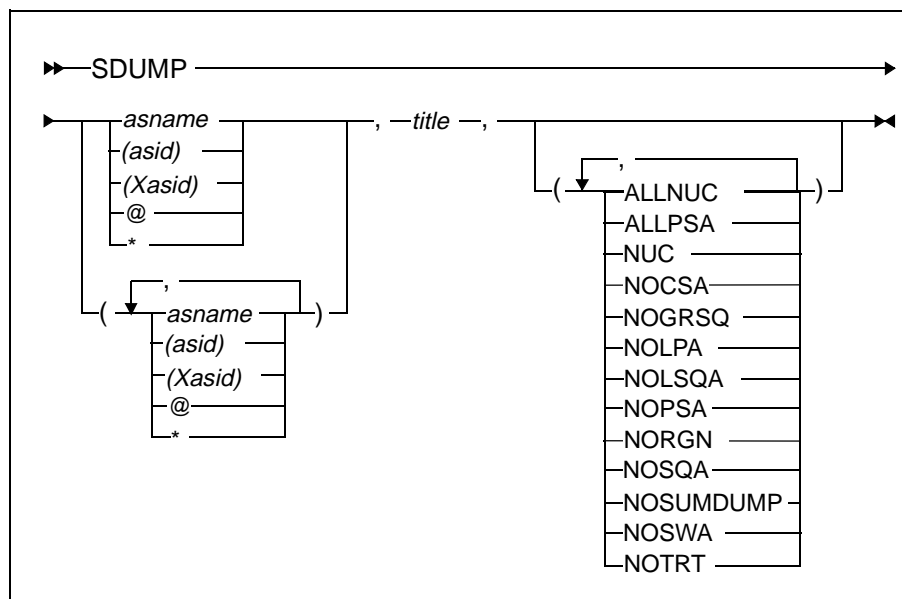

2. The hexadecimal address space identifier. This field contains asterisks (****) for the free space and system table entries.
3. The total number of frames allocated to the address space or system area.
4. The total number of frames allocated to the address space or system area that are currently marked as fixed. This is a subset of the total frame count provided in the **FRAMES** field.
5. The total number of frames allocated to the address space or system area that are currently marked as fixed below the 16 MB line. This is a subset of the total fixed-frame count provided in the **FIXED** field.
6. The total number of frames allocated to the local system queue area for the listed address space. This value is a subset of the total fixed-frame count provided in the **FIXED** field.
7. The working set size of this address space at the time of the last swap-out. This field is valid only for swappable address spaces. The nonsystem address spaces, which start out as swappable but later change status to nonswappable, continue to display what appears to be a fixed working set size. In this case, the count actually shows the working set size at the time the address space became nonswappable.
8. The percentage of online real-storage frames allocated to this address space. This value is calculated as: Total frames (pageable and fixed) allocated to the address space or system area, divided by RCEPOOL, multiplied by 100%.

If the result of this calculation yields a result less than 1%, the field is replaced by dashes (--).

SDUMP

The SDUMP (SD) service takes an SVC dump of one or more address spaces. The SDUMP service works in conjunction with the SYSDUMP service (which lists the SVC dump data sets) and the CLEAR service (which clears the SVC dump data sets). See “SYSDUMP” on page 4-220 and “CLEAR” on page 4-29 for more information.

Syntax

where

<i>asname</i>	Is the name of the address space to be dumped. If you specify multiple address spaces, enclose them in parentheses and separate them with commas.
<i>(asid)</i>	Is the address space identifier in decimal format.
<i>(Xasid)</i>	Is the address space identifier in hexadecimal format.
@	Specifies your own address space.
*	Specifies the last address space entered.
<i>title</i>	Is the title to be placed on the SVC dump data set.
ALLNUC	Includes the DAT-ON and DAT-OFF nuclei in the display. These areas are not dumped by default.

ALLPSA	Includes all of the prefixed storage areas (PSAs) in the system. These areas are not dumped by default.
NUC	Includes the non-page-protected areas of the DAT-ON nucleus in the display. These areas are not dumped by default.
NOCSA	Suppresses display of the CSA and ECSA subpools. These areas are dumped by default.
NOGRSQ	Suppresses display of the global resource serialization control blocks. These control blocks are dumped by default.
NOLPA	Suppresses display of the active link-pack area modules and SVCs. These areas are dumped by default.
NOLSQA	Suppresses display of the LSQA and ELSQA subpools. These subpools are dumped by default.
NOPSA	Suppresses display of the PSA for one processor, which is either the processor at the time of the error or the processor at the time of the dump. The PSA is dumped by default.
NORGN	Suppresses display of the allocated pages in the address space's private area. These pages are dumped by default.
NOSQA	Suppresses display of the SQA and ESQA subpools. These subpools are dumped by default.
NOSUMDUMP	Suppresses display of a summary dump. This dump is included by default.
NOSWA	Suppresses display of the scheduler work area subpools for the address space. These subpools are dumped by default.
NOTRT	Suppresses display of the system trace table, the GTF trace records, and master track data, if these traces are active. These areas are dumped by default.
<p>Note: These areas are defined by IBM. For more information, see the IBM publication, <i>z/OS MVS Auth Assm Services Reference LLA-SDU</i>.</p>	

Examples

To obtain a dump address space INVENTORY, adding the title “DUMP1,” type

```
sdump inventory dump1
```

```
AMTSD7I  DUMP IN PROGRESS  ①
AMTSD2I  COMPLETE DUMP TAKEN FOR INVENTORY  ②
```

To obtain a dump of address space INVENTORY, the address space with ASID 280, and your own address space, type

```
sdump (inventory,(280),@)
```

```
AMTSD7I  DUMP IN PROGRESS  ①
AMTSD7I  DUMP IN PROGRESS
AMTSD7I  DUMP IN PROGRESS
AMTSD2I  COMPLETE DUMP TAKEN FOR INVENTORY  ②
AMTSD2I  COMPLETE DUMP TAKEN FOR ASID 280
AMTSD2I  COMPLETE DUMP TAKEN FOR @
```

To obtain a dump of address space INVENTORY, adding the title “DUMP2” and suppressing the trace table dump and summary dump, type

```
sdump inventory,dump2,(notrt,nosumdump)
```

```
AMTSD7I  DUMP IN PROGRESS  ①
AMTSD2I  COMPLETE DUMP TAKEN FOR INVENTORY  ②
```

Legend:

1. Indicates that an SVC dump is being taken.
2. Indicates that an SVC dump has been successfully created.

SETOP

The SETOP (SET) service allows you to set options specific to your MAINVIEW for OS/390 session. You can display the current option settings by typing **SETOP** without any operands or change an option by specifying it as a SETOP parameter.

Syntax

where

MSGID	Indicates that message numbers are to be displayed at the beginning of messages produced by MAINVIEW for OS/390 services.
NOMSGID	Indicates that message numbers should <i>not</i> be displayed on messages produced by MAINVIEW for OS/390 services.
CAPSON	Indicates that messages are to be displayed in uppercase.
CAPSOFF	Indicates that messages are to be displayed in uppercase and lowercase.

Examples

To display the current options, type

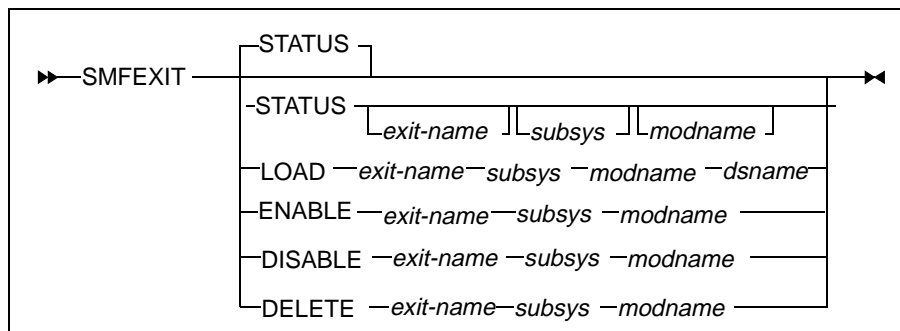

```
set
```

```
AMTS01I MSGID CAPSOFF
```

An *exit point* (also called simply an exit) calls the exit routine. The exit point is uniquely identified by a combination of the SMF exit name and the subsystem name. Multiple exit routines can be loaded and enabled for a given exit point.

An *exit routine* is a load module that is called by an exit point. The exit point can establish requirements for the exit routine. The exit can require that the exit routine be re-entrant or that it be in a certain addressing mode. All exit routines must be loaded from an APF-authorized data set. The same exit routine can be used with multiple exit points if designed for this purpose. BMC Software recommends that user-written or third-party exit routines be given names that do not duplicate existing IBM exit names. For example, use XYZUVJ instead of IEFUVJ.

Syntax

where

STATUS

- If you specify the exit name, all exit routines for the specified exit name will be displayed.
- If you specify a subsystem name, all exit routines for the subsystem will be displayed.
- If you specify both an exit name and a subsystem name, only the exit routines for that subsystem and exit will be displayed.
- If you specify a module name, all exits using that module name will be displayed.

LOAD	<p>Causes the load module (exit routine) to be associated with the specified SMF exit point. The exit point is identified by the SMF exit name and the subsystem name.</p> <p>The operating system does not actually load the module until you ENABLE the exit. However, validation is performed by the SMFEXIT LOAD operation. If successful, the exit routine you have loaded will be loaded under DISABLE status. To activate the exit, you must use the ENABLE function.</p> <p>You can associate multiple exit routines with the same exit as long as they have different load module names. To reload the exit routine (MODNAME) for the same exit, you must first DISABLE and then DELETE the exit routine. New versions of an exit routine should be uniquely named so that the prior version can be retained (in a DISABLE status). This way, it can be reactivated (ENABLE) if the new exit routine is in error.</p> <p>You must specify the exit name, subsystem name, and load module name on the LOAD request. The data set name is also required unless previously specified.</p>
ENABLE	<p>Causes the specified exit routine (MODNAME) to be activated for the specified exit point.</p> <p>Initially, modules are loaded in DISABLE status and therefore cannot be called by the exit point until you change their status to ENABLE.</p> <p>The SMF exit name and the subsystem name are combined to form an exit identifier that uniquely identifies the exit point. One or more exit routines can be associated with (called by) a single exit point (or exit). The exit routine is identified by its load module name (MODNAME).</p>
DISABLE	<p>Changes the status of the exit routine for the specified exit to DISABLE. The exit routine remains in storage and can be changed to an ENABLE status again unless the DELETE function is used to delete the exit routine.</p> <p>You must specify the exit name, subsystem name, and load module name to use the DISABLE command to disable the exit routine.</p>
DELETE	<p>Causes the exit routine to be removed from storage. The exit routine must be disabled with the DISABLE command before it can be deleted.</p> <p>You must specify the exit name, subsystem name, and load module name to use the DISABLE command to disable the exit routine.</p>
<i>exit-name</i>	<p>Name of the SMF exit that is to be used with the LOAD, ENABLE, DISABLE, or DELETE commands or that is to be displayed by the SMFEXIT service. Valid SMF exit names are ACTRT, UJI, UJP, UJV, USI, USO, UTL, U29, U83, and U84.</p> <p>The SMF exit name and the subsystem name are combined to form an exit identifier that uniquely identifies the exit point. One or more exit routines can be associated with (called by) a single exit point (or exit). The exit routine is identified by its load module name (MODNAME).</p>

<i>subsys</i>	<p>Name of the subsystem. This is the subsystem name to be used to identify the exit point. For STATUS requests, the subsystem name can be specified individually or in combination with other parameters to limit the display.</p> <p>Valid subsystem names are SYS, TSO, JES2, and JES3.</p> <p>The SMF exit name and the subsystem name are combined to form an exit identifier that uniquely identifies the exit point. One or more exit routines can be associated with (called by) a single exit point (or exit).</p>
<i>modname</i>	<p>Load module name for the exit routine. An exit routine can be associated with (loaded and enabled for) multiple exit points if desired. An exit point is uniquely identified by an exit identifier that is a combination of the SMF exit name and the subsystem name.</p> <p>In addition, multiple exit routines (each with a unique load module name) can be loaded and enabled for a given exit point. However, multiple versions of an exit routine with the same load module name are not supported.</p> <p>The default module name is the IBM exit routine name. However, BMC Software recommends that you use a name other than the IBM name when creating an exit routine.</p>
<i>dsname</i>	<p>Name of the data set containing the exit routine (MODNAME) that is to be loaded. When specified, the data set name is retained for the life of the MAINVIEW for OS/390 session and, therefore, need not be respecified on subsequent LOAD requests.</p> <p>The data set must be a partitioned data set. It must be cataloged and it must be APF authorized. If it is not APF authorized, the MAINVIEW for OS/390 APF service can be used to authorize it.</p>

Usage Notes

- Exit routines are disabled when loaded. The exit routine will not be called by the SMF exit until it has been enabled.
- The exit routine is not actually loaded into storage until you use the ENABLE command. However, load processing validates the exit routine.
- For load requests, the data set name is required. However, the data set name is retained for the life of the MAINVIEW for OS/390 session and, therefore, need not be reentered on subsequent LOAD requests.
- The SMF exit (exit) calls the exit routine. You can load and enable multiple exit routines for the same exit. You can also load and enable the same exit routine for multiple SMF exits.
- Although multiple exit routines can be loaded and enabled for a single exit, each exit routine must have a unique name. For this reason, BMC Software recommends that you do not give your exit routine the same name as that of a supplied IBM exit routine. For example, use MYUJV instead of IEFUJV.

- An SMF exit is uniquely identified by the combination of the SMF exit name and the subsystem name. For example, SMF exit UJV and subsystem STC combine to identify an exit. SMF exit UJV and subsystem SYS combine to identify a different exit.
- For STATUS requests, you can specify any combination of parameters to limit the display. If you do not specify any parameters, all exit routines will be displayed.

SMFINFO

The SMFINFO (SMFI) service displays information for the SMF data sets and the data that has been written to them.

Syntax

▶▶SMFINFO ◀◀

Example

smfi

```
AMTSI1I Records lost=                0
AMTSI2I Records written=            246,834
AMTSI3I Buffers written=             67,318
AMTSI4I Avg records/buffer=          3.67
AMTSI5I Buffer size=                  4,096
AMTSI6I Full buffers=                 0
AMTSI7I Maximum Buffers              672
AMTSI0I
AMTSI8I Pct Used   Total Blocks   Status   Data Set Name
AMTSIH I -----
AMTSI9I   48.83%      15,000   Active   SYS1.MAN1
AMTSI9I    0.00%      15,000   Ready    SYS1.MAN2
AMTSI9I    0.00%      15,000   Ready    SYS1.MAN3
AMT001A SYSPROG
```

The buffer size is also the Control Interval (CI) size. The number of full buffers is usually zero and rarely more than one.

SMSLIST

The SMSLIST (SMS) service applies to OS/390 systems that use system-managed storage (SMS). For DASD volumes under control of SMS, the SMSLIST service displays

- storage group names
- space usage

Syntax

where

LIST	Lists either DASD volumes and storage group names or storage groups and their associated DASD volume names, as indicated by the second parameter; the default.
STATUS	Lists storage group and volume names for DASD volumes along with their status, space usage, percentage of free space, and largest free extent.
SGNAME	Specifies that information about storage groups is listed; the default. If you specify SGNAME with STATUS, the SMS information is listed in ascending alphanumeric order by storage group. If you specify SGNAME with LIST, the storage group names and the names of all DASD volumes in the storage group are listed.
VOLUME	Specifies that information about DASD volumes is listed. If you specify VOLUME with LIST, a list of DASD volumes and each volume's storage group name is listed. If you specify VOLUME with STATUS, the SMS information is listed in ascending alphanumeric order by volume name.
<i>name</i>	Limits the information displayed to the specified volume or storage group name that you enter. You can end <i>name</i> with an asterisk (*) to request a generic search (for example, MVS* for all names starting with MVS). Note: If you specify SGNAME, you can type any storage group name. If you specify VOLUME, you can type any DASD volume ID.

Examples

To list DASD volumes and each volume's storage group name, type

```
smslist list volume
```

AMTSSB1	VOLUME	GROUP	VOLUME	GROUP
AMTSSB2	-----	-----	-----	-----
AMTSSCI	BBSMS1	BBSG		

To display the status, space usage, percentage of free space, and the largest free extent for storage group BBSG, type

```
smslist status sname bbsg
```

AMTSSF1	-- SG --	VOLUME	----	STATUS	----	-----	SPACE	-----	ERROR
AMTSSF2	NAME	ID		MVS	SMS	FREE	L-XTENT	TOT CAP	FLAG
AMTSSF3							(MB)	(MB)	
AMTSSF4	-----	-----	-----	-----	-----	-----	-----	-----	-----
AMTSSCI	BBSG	BBSM	ONLINE	ENABLED		99.2%	300	602	

- reads and summarizes software records from the LOGSTREAM or a LOGREC data set
- displays information about software errors
- displays software records for a specific module name
- can use previously allocated LOGREC data sets (other than SYS1.LOGREC)

Syntax

<i>modname</i>	When specified, only records containing the specified modname in the recording parameters are selected.
N/A	When specified, indicates that only records with a blank module name in the recording parameters are selected.
*	When specified, indicates that all records are selected. When specified without MAP, abstract data is displayed for each record, rather than a summary report.
MAP	Indicates that all data in the selected software LOGREC records is displayed. This data includes an English translation of all flags and the data in the Variable Recording Area, if any.
<i>seq_num</i>	When specified, only records containing the specified sequence number (error identification number) are selected.

<i>yy.ddd</i>	Is the Julian date. When specified, only records created on or after the specified Julian date are selected.
LOGSTREAM	When specified as the fourth parameter, indicates that records are obtained from the logstream, even if records are not currently being recorded in the logstream. To display records from the current recording media, omit the fourth parameter.
<i>dsname</i>	Is the name of the data set assumed to be a LOGREC data set when a value other than LOGSTREAM is specified as the fourth parameter. The records are obtained from this data set even if it is not currently being used for recording errors. To display records from the current recording media, omit the fourth parameter.

Note: If you type **SOFTFRR** without operands, the service summarizes all software records in the LOGREC data set.

Examples

To summarize all software records, type

softfrr

```
AMTL3NI Processing logstream SYSPLEX.LOGREC.ALLRECS
AMTL31I      67 Records read;      17 Records accepted
AMTL39I      N/A      00003 IXGINLPA 00003 IGC0013I 00001
AMTL39I IKJEFLC 00003 ISLOAD 00001 NUCLEUS 00001
AMTL39I BBM33 00001 XDCCALL 00001 IMF      00001
AMTL39I BBI    00002
                ①          ②
```

Legend:

1. Lists all modnames for which there is data. N/A (not available) means that the module identifier consists of binary zeros.
2. Shows the number of records for each modname.

To display all of the data for records containing the modname BBM33, type

soft,bbm33,map

```

4. Displays variable recording area (VRA) data, if any.

SPACE

The SPACE (SPA) service determines the amount of space available on a set of specified devices and displays the amount by device number. Use this service to find volumes that contain a specified minimum amount of available contiguous space, in cylinders.

Syntax

where

<i>dvn</i>	Is a device number.
<i>volser</i>	Is a complete six-character volume serial number.
<i>generic</i>	Is a generic or esoteric device name.
<i>partial</i>	Is the first one to five characters of a volume serial number.
<i>>cylinders</i>	Specifies a minimum amount of available contiguous space, in cylinders. When this parameter is specified, the output is sorted in descending order by the CONTIG field, unless specified otherwise. When this parameter is omitted, the output is sorted in descending order by the FREE field, unless specified otherwise.
ALL	Displays both online and offline devices.
PRV	Specifies that only devices with a mount attribute of PRV (Private) be displayed.
PUB	Specifies that only devices with a mount attribute of PUB (Public) be displayed.
STG	Specifies that only devices with a mount attribute of STG (Storage) be displayed.
UNIT	Specifies that the output be sorted in ascending order by unit address; the default.
VOLSER	Specifies that the output be sorted in ascending order by volser.

FREE	Specifies that the output be sorted in descending order by the amount of free space. Only the 10 devices or volsers with the highest amount of free space are displayed.
CONTIG	Specifies that the output be sorted in descending order by the amount of contiguous free space. Only the 10 devices or volsers with the highest amount of contiguous free space are displayed.

Examples

To display disk space for the SYSALLDA esoteric unit name, type

```
space sysallda free
```

	①		②			③	
AMTS10I	ESOTERIC	UNITNAME	SYSALLDA	DEFINES		3	DEVICES
	④	⑤	⑥		⑦		⑧
AMTS11I	UNIT	B13	SYSP3B	PUB	FREE= 130 CYL/ 21 TRK;	CONTIG= 100 CYL/ 11 TRK	
AMTS11I	UNIT	500	SYSR1A	STR	FREE= 124 CYL/ 71 TRK;	CONTIG= 13 CYL/ 0 TRK	
AMTS11I	UNIT	240	SYSP2B	PRV	FREE= 20 CYL/ 21 TRK;	CONTIG= 10 CYL/ 11 TRK	

Legend:

1. GENERIC or ESOTERIC.
2. Requested generic or esoteric unitname.
3. Number of devices described by the generic or esoteric unitname.
4. Unit address.
5. Volume name.
6. Device type:
 - PRV—PRIVATE.
 - PUB—PUBLIC.
 - STR—STORAGE.
7. Number of free cylinders and tracks.
8. Largest number of contiguous cylinders and tracks.

To display disk space for devices that start with a partial volume serial number of TNT and have more than 20 cylinders of contiguous free space, type

```
space tnt >20
```

AMTS11I	UNIT	B13	TNT001	PRV	FREE= 16 CYL/ 260 TRK;	CONTIG= 12 CYL/ 10 TRK
AMTS11I	UNIT	B13	TNT002	PRV	FREE= 40 CYL/ 260 TRK;	CONTIG= 23 CYL/ 1 TRK
AMTS11I	UNIT	B13	TNT003	PUB	FREE= 83 CYL/ 260 TRK;	CONTIG= 44 CYL/ 9 TRK
AMTS11I	UNIT	B13	TNT004	STR	FREE= 109 CYL/ 260 TRK;	CONTIG= 100 CYL/ 3 TRK

Examples

To display system resource information, type

srm

```
AMTS30I PARMLIB MEMBERS: IPS=01      OPT=00      ICS=00
AMTS31I ADDRESS SPACES : IN=  45      O/RDY=    0      O/NRDY=  62      LOGWT=nn
AMTS32I RESOURCE STATUS: CPU= 57%      LTCPU= 66%      HIGH UIC= 11
AMTS36I PAGING RATE/SEC: DEMAND=  23    TOTAL=  29      DELAY TIME=  40
AMTS39I THINK TIME(SEC): CURR=  10.0    MIN=   9.0      MAX=  60.0
```

To display the addresses of SRM control blocks as well, type

srm map

```

      ①
AMTS30I PARMLIB MEMBERS: IPS=01      OPT=00      ICS=0
      ②
AMTS31I ADDRESS SPACES : IN=  45      O/RDY=    0      O/NRDY=  62      LOGWT=nn
      ③      ④
      ⑤      ⑥      ⑦
AMTS32I RESOURCE STATUS: CPU= 57%      LTCPU= 66%      HIGH UIC= 11
AMTS36I PAGING RATE/SEC: DEMAND=  23    TOTAL=  29      DELAY TIME=  40
AMTS39I THINK TIME(SEC): CURR=  10.0    MIN=   9.0      MAX=  60.0

RMCT 0111B2A0  RMCA 0111B908  RMPT 0111B898  CCT  0111B4C8
ICT  0111B5C8  MCT  0111B630  LSCT 0111BA68  DMDT 01977D90
CMCT 0111BAA8  CPMT 0196EE20  CMB  01EFE000  CPWK 0196EE00
```

Legend:

1. Name of the installation performance specification member, currently in effect, in the SYS1.PARMLIB library.
2. Number of address spaces currently swapped in memory.
3. Number of address spaces swapped out of memory but ready.
4. Number of address spaces out of memory and not ready.
5. Current SRM-weighted percentage of CPU busy.
6. Long-term SRM-weighted percentage of CPU busy.
7. Highest unreferenced interval count.

To display system resource information for address space INVENTORY, type

srm inventory

```

      ①                ②                ③
AMTS71I JOB 283 INVENTORY STEP1 PRTY 6(111) PGP 2/1
AMTS72I TRANSACTION DATA: INTERVAL 2:26:14 DOMAIN 3 ④
      ⑤
AMTS73I LAST SWAP      : INTERVAL 0:00:16 REASON IN MEMRY COUNT 254 ⑥
AMTS74I SWAPPING PROFILE: COUNT 1 PGS-OUT N WRK-SET 91 ⑦
AMTS75I SERVICE DATA  : CPU 29205 I/O 6450 MSO 4100 TOTAL 39755 ⑧

```

Legend:

1. Job ID, jobname, and stepname for the specified job.
2. Priority and internal dispatching priority.
3. Performance group and period.
4. Duration of this particular transaction. The DOMAIN value is the IPS domain in which this job resides.
5. The **LAST SWAP INTERVAL** is the time since the last swap action. If the job is in memory, this value is the amount of time that it has been in; if it is out of memory, it is the amount of time that it was swapped out.

The REASON code shows the cause of the current swap status. Allowable codes are as follows:

Code	Description
ASM LOW	swapped out due to auxiliary storage shortage
ENQ EX	swapped out due to enqueue exchange
IN MEMRY	swapped in
LONG WT	swapped out due to long wait
MSO WAIT	swapped out due to MSO-detected long wait
REC EX	swapped out due to recommendation values
REQUEST	swapped out due to a request swap
RSM LOW	swapped out due to a real-storage shortage
TERM IN	swapped out due to terminal input wait
TERM OUT	swapped out due to terminal output wait
UNILTRL	swapped out due to unilateral swap-out

6. Number of swaps during the life of the current transaction.

7. Pages swapped at last swap-out, and the working-set size at swap-in.
8. Service units for this transaction. Values are as follows:

Name	Description
CPU	CPU service units
I/O	I/O service units
MSO	main storage occupancy service units
TOTAL	total service units for this transaction

Note: The appearance of *** means that these values are temporarily invalid because they are being updated by SRM. Invoke the SRM service again to display updated values.

SSVT

The SSVT service maps information from the Subsystem Communications Vector Table (SSCVT). This service can also list information for a single subsystem and dynamically add a subsystem without having to re-IPL. This service also identifies the subsystems used and locates their respective Subsystem Vector Table (SSVT) control blocks.

Syntax

where

<i>subsystemID</i>	Is the name of the subsystem that you want to list or add.
LIST	Lists information on the specified subsystem from the Subsystem Communications Vector Table (SSCVT).
ADD	Dynamically adds the specified subsystem to the system. The subsystem remains on the system until the next IPL. To permanently add the subsystem, you must modify SYS1.PARMLIB(IEFSSN00).

Note: If you type SSVT without parameters, SSCVT information from all subsystems is listed.

Example

To map information from the SSCVT, type

ssvt	①	②	③	④	⑤
AMTB61I	SSCVT=005D26E8	NAME=JES2	(D1C5E2F2)	SSVT=005D5450	SUSE=00000000
AMTB61I	SSCVT=005D26C0	NAME=MSTR	(D4E2E3D9)	SSVT=00950EE8	SUSE=00000000
AMTB61I	SSCVT=005D2010	NAME=CICS	(C3C9C3E2)	SSVT=00000000	SUSE=00000000
AMTB61I	SSCVT=00950908	NAME=JES1	(D1C5E2F1)	SSVT=00000000	SUSE=00000000
AMTB61I	SSCVT=009508E0	NAME=OCCF	(D6C3C3C6)	SSVT=00000000	SUSE=00000000
AMTB61I	SSCVT=009508B8	NAME=RES.	(D9C5E240)	SSVT=00000000	SUSE=00000000
AMTB61I	SSCVT=009490F8	NAME=SIMS	(E2C9D4E2)	SSVT=00000000	SUSE=00000000
AMTB61I	SSCVT=00631698	NAME=VX..	(E5E7000E)	SSVT=00610EC8	SUSE=00000000
AMTB61I	SSCVT=006621C8	NAME=IMF1	(C9D4C6F1)	SSVT=006621F0	SUSE=0093A3D0
AMTB61I	SSCVT=006648C8	NAME=RB20	(D9C2F2F0)	SSVT=00664938	SUSE=008ECBD0

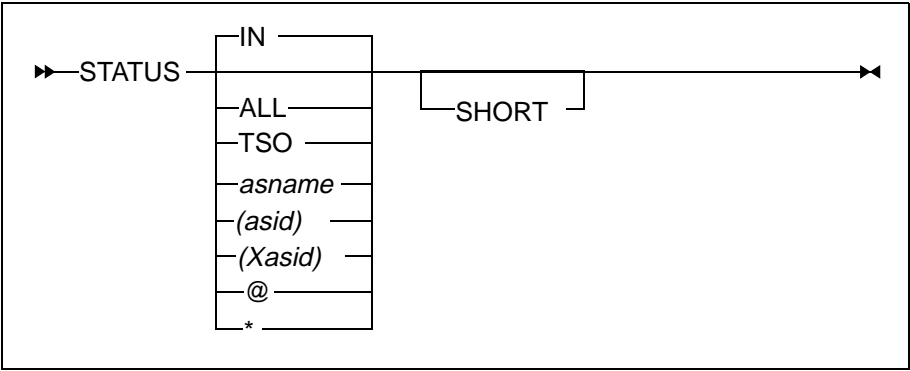

Legend:

1. Address of the SSCVT for this subsystem.
2. Subsystem name.
3. Subsystem name in hexadecimal format.
4. Address of the SSVT for this subsystem; zero if the subsystem is not active.
5. Contents of the SSCVTSUSE field for this subsystem.

STATUS

The STATUS (STA) service monitors and displays the current status of active address spaces in the system.

Syntax

where

IN	Displays the status of all address spaces swapped in memory; the default.
ALL	Displays the status of all address spaces.
TSO	Displays the status of all TSO users.
<i>asname</i>	Displays the status of a specific address space name.
<i>(asid)</i>	Is the address space identifier in decimal format.
<i>(Xasid)</i>	Is the address space identifier in hexadecimal format.
@	Displays the status of your own address space.
*	Displays the status of the last address space entered.
SHORT	Shortens the display to accommodate console screen width.

Examples

To display the status of all active address spaces swapped in memory, type

```

status
      ①      ②      ③      ④      ⑤
AMTS21I INVENTORY ( 6) IN CP FM( 35) WS( 16) CPU 1234.56 Q(09)PGP 10/1

AMTS21I CONSOLE    (10) NSW      FM(155) WS(*** ) CPU 22.46 TRQ  PGP 1/ 1

```

Legend:

1. Address space name.
2. Address space ID (ASID).
3. Status indicator #1. Possible values are as follows:

Value	Description
NSW	Nonswappable
LS	Logically swapped
PVL	Privileged
OUT	Swapped out of memory
GOI	Going in
GOB	Going between states
ENQ	Enqueue privileged
IN	In memory
GOO	Going out of memory

4. Status indicator #2. Possible values are as follows:

Value	Description
LS	Address space is logically swapped-out
MS	Main storage optimized detected long wait
LW	Long wait (explicit)
CP	Significant CPU user

5. Real frames currently in use by this address space.
6. Current working set in pages. If a job is nonswappable, the working set is displayed as ***. The current working set is the number of page frames swapped at the last swap action. This value is also the number of page frames necessary to swap in an address space.
7. CPU time used by the current step in this address space, in seconds and hundredths.
8. TRQ indicates that the address space is on the truly ready queue; NTRQ indicates that the address space is *not* on the truly ready queue.
9. Performance group and period for this address space. An asterisk (*) indicates that the value is temporarily invalid.

SUBMIT

The SUBMIT (SUB) service submits a job from the specified data set to the job entry subsystem. This service enables you to submit JCL for routine operations jobs. Because the JCL contains a JOB statement, a valid user account code can be used for accounting purposes. The job runs as a problem program; consequently, you can obtain SMF data.

Syntax

where

<i>member</i>	Is a member in the BBPARM library data set.
<i>dsname</i>	Is the name of the data set containing the member to be submitted. If you do not specify a data set name, the data set last specified on a SUBMIT command is used. Therefore, if you are submitting multiple members from the same data set, you only need to specify the data set name on the first SUBMIT command. If you have not specified a data set name and DDNAME BBPARM was preallocated, that data set will be used.

Example

To submit BBPARM library member *backup* to the job entry subsystem, type

```
submit backup
```

```
AMTV11I  MEMBER BACKUP  SUBMITTED TO JOB ENTRY SYSTEM
```

To submit the jobs in member *backup* in data set MY.PARMLIB, type

```
submit backup,my.parmlib
```

If this data set name was previously entered, the previous data set MY.PARMLIB will be used. If a data set was *not* previously specified and DDNAME BBPARM was preallocated, that data set will be used.

To submit the jobs in member *backup2*, type

```
submit backup2
```

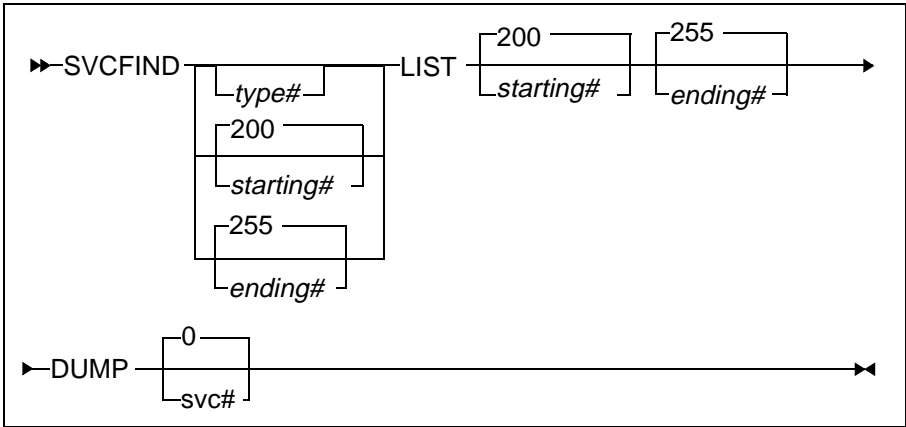

SVCFIND

The SVCFIND (SVC) service

- scans the SVC table, locating and displaying information about SVCs
- lists unused SVCs
- dumps the first 64 bytes of the SVC module from main storage
- helps you plan the installation of new SVCs

For information on loading SVCs into main storage, see “LOADLPA” on page 4-109.

Syntax

where

<i>type#</i>	Is a one-digit SVC type number (1, 2, 3, 4, or 6). SVCFIND displays unused SVC table entries that equal the type number.
<i>starting#</i>	Is a one- to three-digit SVC number. The display begins with this number. The default is 200.
<i>ending#</i>	Is a one- to three-digit SVC number. The display ends with this number. The default is 255.
LIST	Displays all SVC numbers in the specified starting number and ending number range.
DUMP	Displays the first 64 bytes of the specified <i>svc#</i> from main storage.
<i>svc#</i>	Is a one- to three-digit SVC number; this number cannot exceed 255. The default is 0.

Note: If no operands are specified, SVCFIND displays all unused SVC table entries, regardless of type number. This option is the default.

Examples

To display SVC table entries for unused Type 2 SVC numbers between 240 and 245, type

```
svcfind 2 240 245
```

```
AMTY11I UNUSED SVCTABLE ENTRIES 240-245 TYPE=2
```

				①	①		①	①	②		③		④
AMTY13I	SVC#	TYPE	EPA	APF	NP	ESR	ASF	LOCKS	TABLE-ADR	FLAGS			
AMTY14I	240	2	-UNUSED-	N	N	N	Y	NONE	00FDB4A0	81000000			
AMTY14I	243	2	-UNUSED-	N	N	N	Y	NONE	00FDB4B0	81000000			

To display all SVC types, used and unused, between 199 and 201, type

```
svcfind list 199 201
```

```
AMTY11I SVCTABLE ENTRIES 199-201
```

				①	①		①	①	②		③		④
AMTY13I	SVC#	TYPE	EPA	APF	NP	ESR	ASF	LOCKS	TABLE-ADR	FLAGS			
AMTY14I	199	2	-UNUSED-	N	N	N	Y	NONE	00FDB358	81000000			
AMTY14I	200	2	-UNUSED-	N	N	N	Y	NONE	00FDB360	81000000			
AMTY14I	201	2	00E1AC10	Y	N	N	N	NONE	00FDB368	C8000000			

To dump the first 64 bytes of storage for SVC 235, type

```
svcfind dump 235
```

```
AMTY15I SVC 235 DISPLAY
```

	⑤										⑥

AMTY16I	01AF6030	D6D6D3C5	40C1D5C4	40C2C1C2	C2C1C7C5	*OOLE.AND.BABBAGE*					

Legend:

1. Bit settings in the SVCTABLE entry. Refer to the IBM Publication, *z/OS MVS Data Areas Vol 5*, for a description of the SVCTABLE data area.
2. Highest lock required by the SVC first-level interrupt handler; the lock is obtained from the SVCLOCKS field of the SVCTABLE.
3. Address of the SVCTABLE entry for the appropriate SVC.

4. A hexadecimal display of the SVCATTR and SVCLOCKS fields from the SVCTABLE entry.
5. The starting address of the storage being dumped, and the hexadecimal and EBCDIC representation of that data.
6. Text representation of the dump.

SYSDUMP

The SYSDUMP (SYS) service displays the title of the dump, as well as the date and time the dump was taken for each active dump data set. This service also determines if SVC dumps should be retained or deleted, which helps prevent the loss of important dumps due to all dump data sets being full. (See “CLEAR” on page 4-29 for information on clearing dump data sets.)

Syntax

»—SYSDUMP —«

Example

To display information about each active dump data set, type

sysdump

	①		②
AMTDU0I	SYS1.DUMP01	WAS FILLED AT 10:21 ON MAR 14, 1996	
	③		
AMTDU1I	SOURCE=SVCDUMP		
	④		
AMTDU2I	TITLE=ERROR IN TSO		

Legend:

1. A full-dump data set.
2. Time and date of dump.
3. System component that took the dump.
4. Message text describing the dump.

TCB

The TCB service displays internal values of task control blocks (TCBs) and request blocks (RBs) belonging to an address space.

Syntax

where

<i>aname</i>	Is the address space name.
<i>(asid)</i>	Is the address space identifier in decimal format.
<i>(Xasid)</i>	Is the address space identifier in hexadecimal format.
@	Specifies your own address space.
*	Specifies the last address space entered.
@TCBnnn	Is the symbol generated by the TCB service when one of the other parameters is used by a prior invocation. One symbol is generated for each TCB within the target address space, and the symbols are numbered consecutively beginning with 001. The symbols are deleted and reassigned each time the TCB service is invoked specifying any value other than @TCBnnn as the first parameter.
MAP	Causes the general registers from the request block to be displayed.
ALL	Causes all TCBs associated with the requested address space to be displayed.
<i>address</i>	Is the hexadecimal address of the current step or subtask TCB.

Example

To display the internal TCB and RB values for address space INVENTORY,
type

tcbl inventory map

```

      ①                ②                ③                ④

Legend:

1. Address space name (source: TIOCNJOB).
 2. Current stepname of this address space (source: TIOCSTEP).
 3. Priority of the address space.
 4. Total number of TCBs for the address space.
 5. Number of the TCB being displayed.
 6. Address and dispatching priority of the TCB.
 7. Nondispatchability flags (TCBFLGS4 and TCBFLGS5).
 8. Protect key.
 9. TCB chaining pointers.
 10. Type and address of each RB associated with this TCB, and the entry-point address and name of the module. SVC numbers are given in decimal format; for example, SVC-18 corresponds to BLDL.
- ❶ Current PSW in this RB.
 ❷ Wait count of the RB.
 ❸ CDE address.
 ❹ Registers for the RB, which are displayed only when the MAP option is specified.

To display detailed information for the specific TCB referenced by the @TCBnnn symbol, type

tcb,@tcb004

TERM

The TERM (TER) service displays information about partially terminated address spaces.

Syntax

▶—TERM—▶

Example

To display address spaces in abnormal termination, type

term

	①	②
AMTT11I	JOB INVENTORY	FAILED CODE SOC7
AMTT11I	JOB UPDATE1	FAILED CODE U0001

Legend:

1. Job that is in abnormal termination.
2. Abend code for failed job.

TIME

The TIME (TIM) service displays date and time. The date is displayed in both Gregorian and Julian formats. The Greenwich Mean Time (GMT) time display includes the offset to the local time.

Syntax

where

GMT Displays the Greenwich Mean Time specified by the operator at the time of IPL.

Examples

To display the current date and time, type

```
time
AMTT32I    DATE 3/21/1996 (1996.081), local time 11:39:39.82
```

Legend:

1. Gregorian date.
2. Julian date.
3. Local time in hours, minutes, seconds, and hundredths of seconds.

To display the current date and GMT time, type

```
time,gmt
AMTT32I    DATE 3/21/1996 (1996.081), GMT time 19:45:40.56 (Local -8:00:00)
```

Note: You can type the TIME GMT command with or without a comma.

Legend:

1. Gregorian date.
2. Julian date.
3. Greenwich Mean Time.
4. Local time offset from Greenwich Mean Time.

TIOT

The TIOT (TIO) service displays all allocated devices for a specified address space and monitors the usage of data sets by address space.

Syntax

where

<i>asname</i>	Is an address space name.
<i>(asid)</i>	Is an address space identifier in decimal format.
<i>(Xasid)</i>	Is an address space identifier in hexadecimal format.
@	Specifies your own address space.
*	Specifies the last address space entered.
MAP	Displays the data set name(s) associated with each TIOT entry.
ACT	Displays the active TIOT entries that contain data sets with nonzero EXCP counts. The data set names are listed, as is the case with MAP.
<i>ddname</i>	Is the name of a DD statement. Specifying this parameter displays the data set names associated with the specified DD name.

Note: If, within a concatenation, more than one of the data sets are allocated to a common volume, TIOT attributes all the EXCPs for the data sets sharing that volume to the first data set within the concatenation that is on the current volume.

For data sets sharing a common volume within a concatenation, IBM updates the TCT I/O table only for the first data set in the concatenation that resides on that volume.

Examples

To display all allocated devices for address space INVENTORY and display the data set name associated with each TIOT entry, type

```

tiot inventory map
      ①      ②      ③      ④      ⑤
AMTE11I JOB  332  INVENTORY  UPDATE1  PRTY 279  PAGE I/O'S 1044

AMTE12I DD SYS00003 UNIT 254  VOLUME PUB002  EXCP  15
AMTE13I          DSN  SYSCTLG.PUB002

```

Legend:

1. JES job ID.
2. Name of the specified address space.
3. Current stepname for the specified address space.
4. Internal dispatching priority for the address space.
5. Total page faults requiring a page I/O operation for this address space.
6. DD name.
7. Device number.
8. Serial number of volume mounted on device.
9. EXCP count for each data set within each DD name.
10. Data set name associated with TIOT entry; issued only if you specify MAP, ACT, or *ddname*.

To limit output to TIOT entries that have data sets with nonzero EXCP counts, type

```

tiot inventory act
AMTE11I JOB  332  INVENTORY  UPDATE1  PRTY 279  PAGE I/O'S 1044
AMTE12I DD STEPLIB  UNIT 151  VOLUME SYS001  EXCP  604
AMTE13I          DSN  SYS3.RESOLVE.LOAD
AMTE12I          UNIT 250  VOLUME PERF21  EXCP  129
AMTE13I          DSN  BB.CMC.CMC310.LINK
AMTE12I DD SYS00003 UNIT 254  VOLUME PUB002  EXCP  15
AMTE13I          DSN  SYSCTLG.PUB002

```

To limit output to the data set names associated with the DD name STEPLIB,
type

tiot inventory,steplib

AMTE11I	JOB	332	INVENTORY	UPDATE1	PRTY	279	PAGE	I/O'S	1044
AMTE12I	DD	STEPLIB	UNIT	151	VOLUME	SYS001	EXCP	604	
AMTE13I			DSN	SYS3.RESOLVE.LOAD					
AMTE12I			UNIT	250	VOLUME	PERF01			
AMTE13I			DSN	BB.CMC.CMC310.LOAD					
AMTE12I			UNIT	250	VOLUME	PERF21	EXCP	129	
AMTE13I			DSN	BB.CMC.CMC310.LINK					

TPIO

The TPIO (TPI) service displays all outstanding I/O, including TP devices. This service also determines if TP lines are enabled (have outstanding I/O).

Syntax

where

dvn Is the device number for which outstanding I/O is to be displayed.

volser Is the volume serial number for which outstanding I/O is to be displayed.

Examples

To display all outstanding I/O, type

tpio

	①	②	③	④	⑤
AMTI11I	TSO	UNIT 021		IOQ 00F832A0	DRIVER-VTAM
AMTI11I	INVENTORY	UNIT 238	WORK01	IOQ 00F91300	DRIVER-EXCP

Legend:

1. Address space name.
2. Device number.
3. Volume serial number of the device, if DASD or a tape device.
4. IOQ address.
5. Code of the IOS driver. This code can be as follows:

Code	Driver
MISC	Miscellaneous driver
EXCP	EXCP driver

Code	Driver
VSAM	VSAM driver
VTAM	VTAM driver
TCAM	TCAM driver
OLTEP	OLTEP driver
PCIFETCH	Program FETCH driver
JES3	JES3 subsystem
MSS/MSC	Mass storage subsystem
IOSPURGE	Internal IOS PURGE IOQ routine
VPSS	Vector processing subsystem (3838 array processor)
CRYPTO	Cryptographic subsystem
ASM	Auxiliary storage manager (paging supervisor)
DYNPATH	Path reconfiguration
SVC-33	I/O HALT I/O SVC routine
R-CLEAR	Clear device recovery
R-SUBCHN	Subchannel recovery
SVCPURGE	I/O PURGE I/O SVC routine
ALTPATH	Alternate path recovery
MIH	Missing interrupt handler
*UNKNOWN	Unknown or unassigned driver code in use

To display all outstanding I/O for device 283, type

tpio 283

	①		②		③		④	
AMTI31I	STC	205	GOJOB	STEP1	PRTY 7(90)	PGP	1/2	
AMTI32I	UNIT	283	PACK08	IOQ 003F88	IOSB 003F00	DVR	EXCP	⑤
	⑥		⑦		⑧		⑨	
AMTI33I	QDEPTH	5	RSV CNT 0	USE CNT 3	DCB CNT 2			

Legend:

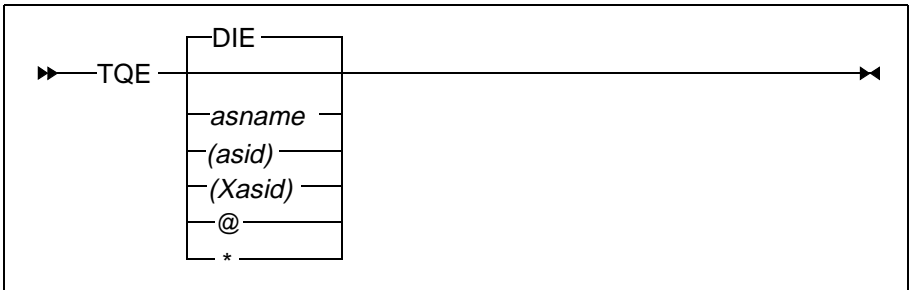

1. JES job ID of the address space using the device.
2. Name and current step for the address space using the device.
3. Dispatching priority for the address space.
4. Performance group and period.
5. Unit, volume serial number, IOQ and IOSB addresses of the I/O, and the I/O driver for this operation.

6. Number of I/Os waiting for access to this device.
7. Number of address spaces that have requested a reserve on this device.
8. Number of address spaces that have allocated this device.
9. Number of open DCBs against this device.

TQE

The TQE service displays information about Disabled Interrupt Exit (DIE) routines scheduled for execution and pending timer interrupts for an address space.

Syntax

where

DIE	Indicates Disabled Interrupt Exit. This operand displays the TQE chain for all DIEs; the default. Note: A DIE executes as an extension to the first-level interrupt handler. Therefore, a DIE routine interrupts and executes under any dispatchable unit of work (TCB or SRB) for any address space.
<i>asname</i>	Is an address space name.
<i>(asid)</i>	Is an address space identifier in decimal format.
<i>(Xasid)</i>	Is an address space identifier in hexadecimal format.
@	Specifies your own address space.
*	Specifies the last address space entered.

Examples

To display the TQE chain for all DIEs, type

tqe

```

AMTQE1I TIMER QUEUE ELEMENTS, ACTIVE AT 11:16:45.59
AMTQE2I EXIPIRE                                TCB
AMTQE3I TIME          JOBNAME      ADDRESS    TYPE      FLAGS    CREATOR
          ①            ②            ③          ④        ⑤        ⑥
AMTQE4I 11:16:45.60  -----      -----      REAL      SRM

AMTQE4I 00:00:00.00 -----      -----      REAL      MIDN

```

Legend:

1. Expiration time for the TQE.
2. Jobname for the TQE.
3. TCB address for the TQE; a value is displayed only if the **TYPE** field contains **TASK** or **WAIT**.
4. Type of TQE; can be **REAL**, **TASK**, **WAIT**, or **UNKN**.
5. Flags for the TQE; flags can be one of the following types:

REAL	Real TQE being timed
USER	Non-system TQE
DUMY	Dummy system TQE
TLIM	Time limit checking system TQE
SRM	System Resources Manager TQE
RMF	RMF system TQE
MIDN	Midnight system TQE
UNKN	Unknown TQE
6. Macro that created the TQE; it can be **SETDIE**, **STIMER**, **STIMERM**, or blank.

To display TQEs for address space JES2, type

tqe jes2

AMTQE1I TIMER QUEUE ELEMENTS, ACTIVE AT 11:19:18.10

AMTQE2I EXIPIRE TCB

AMTQE4I	11:19:29.33	JES2	-----	REAL	USER	SETDIE

TRACK

The TRACK (TRA) service provides a record of services invoked during the session and writes service output to a data set or SYSOUT.

Syntax

where

<i>xx</i>	Is a user-specified suffix. You can track up to 32 services by placing the service names in a member in the BBPARM library data set. The member is named \$\$INTKxx, where xx is the user-specified suffix.
<i>class</i>	Specifies the SYSOUT class to which tracking output is routed.
<i>dsname</i>	Allows specification of a data set name to which output is routed.
ALL	Initiates tracking for every user-invoked service.
STOP	Terminates tracking.
FREE	Deallocates tracking output. If routed to SYSOUT, tracking output is passed to JES for immediate printing.

Examples

To initiate tracking of services specified in member \$\$INTK24 in the data set myid.output, type

```
track 24,myid.output
```

The output produced by the tracked services will be recorded in data set myid.output.

Note: A TRACK command can be included in the \$\$INTKxx member to specify the name of the output data set. If \$\$INTKxx contains a

TRACK command, the first parameter is ignored if it is anything other than ALL. (Nesting is not permitted.)

To initiate tracking of services specified in member \$\$INTK01, type

```
track,01,A
```

The output will be written to SYSOUT class A.

To initiate tracking of all services and record the output in data set myid.output, type

```
track,ALL,myid.output
```

To stop tracking and free an output data set, type

```
track,FREE
```

To stop tracking (leaving an output data set allocated), type

```
track,STOP
```

\$\$INTKxx Control Statements

A \$\$INTKxx member is read from the BBPARM data set under two conditions:

1. During initialization, when \$\$INTK00 is read and processed if present.
2. Whenever a two-character suffix (xx) is specified as the first parameter on a TRACK command.

A \$\$INTKxx member can contain a TRACK command and/or a list of up to 32 services that are to be tracked. Each service must be listed on a separate line beginning in column 1.

When the \$\$INTKxx member contains a TRACK command, the second parameter specifies the SYSOUT class or data set name for the tracking output. If the first parameter is a suffix, it is ignored. If the first parameter is ALL, all services are tracked.

Syntax Rules

1. List each service on a separate statement.
2. Begin each entry in column 1.
3. Enter up to 32 services to be tracked.

Examples

The following statement in \$\$INTK00 will cause all services to be tracked and the tracking output to be written to a SYSOUT class T data set.

```
TRACK,ALL,T
```

The following statements will cause only the CSA and RSM services to be tracked. The tracking output will be written to data set MY.TRACK.DS. The TRACK command can be on any line. If multiple TRACK commands are present, only the last one will be used.

```
CSA  
RSM  
TRA,xx,MY.TRACK.DS
```

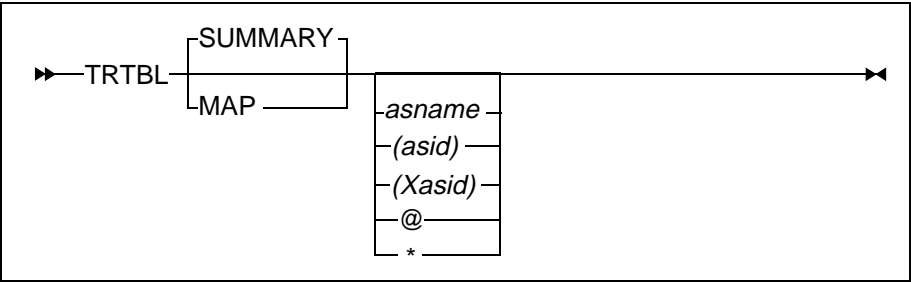

Usage Notes

- Tracking provides a record of command input and output. You can request tracking for all services or up to 32 specific services. You can direct the tracking output to a SYSOUT data set or an existing cataloged data set.
- The tracking facility is controlled by the TRACK service. See “TRACK” on page 4-236 for a description of this service.
- Tracking output is formatted with headings and time stamps. The output format is VBA, and the logical record length is 137 bytes.
- Tracking output is controlled by the second parameter on the TRACK command or by the TRACK DD statement if present. By default, output is written to SYSOUT class A.

TRTBL

The TRTBL (TRT) service displays and summarizes data contained in the system trace buffers. This service provides detailed trace data from either a specific address space or the entire system.

Syntax

where

SUMMARY	Displays summary counts of trace table entries; the default.
MAP	Formats each trace table entry.
<i>asname</i>	Is the address space name.
<i>(asid)</i>	Is the address space identifier in decimal format.
<i>(Xasid)</i>	Is the address space identifier in hexadecimal format.
@	Specifies your own address space.
*	Specifies the last address space entered.

Examples

To summarize all system activity recorded in the trace buffers, type

trtbl										
	①	②								
AMTT29I	TYPE	COUNT	TYPE	COUNT	TYPE	COUNT	TYPE	COUNT	TYPE	COUNT
	SRB	29	DSP	23	SVCR	90	SVC	88	PC	8
	PT	6	SSCH	20	WAIT	23	I/O	22	PGM	2

Legend:

- Trace table entry (TTE) type. Possible trace entry types are as follows:

CLKC	clock comparator interrupt occurred
DSP	task dispatch
I/O	I/O interrupt received from I/O subsystem
PC	program-call instruction executed
PGM	program interrupt occurred
PT	program-transfer instruction executed
SRB	schedule of an SRB
SSAR	set-secondary-address-space instruction executed
SSCH	start-subchannel instruction executed
SVC	SVC instruction executed
SVCR	return from an SVC routine
WAIT	CPU entered the wait state

- The number of entries of this type that are present in the system trace buffers.

To display all system activity recorded in the system trace buffers for address space INVENTORY and a detailed summary and system activity summary for address space INVENTORY, type

trtbl map inventory

	①	②	③	④	④	⑤	⑥	⑦	⑧
AMTT20I	TYPE	DATA	PSW	U1/4/LHS	U2/5/LCL	U3/6/P-S	CP	ASID	TCBTIME
AMTT21I	SVC	3	076C0000	00FAB56A	00A27740	13014A36	00A28C68	02	0008 006FF698
AMTT21I	SVCR	1	076C1000	00007DE0	806FF3E0	00000001	FFFF7DB8	00	0001 00000000
.

.									

		⑨							
AMTT28I	TYPE	DATA	COUNT	TYPE	DATA	COUNT	TYPE	DATA	COUNT
SRB		21	DSP		22	SVC	2	3	
SVC	3	7	SVCR	10	I/O	2DF	3		

AMTT29I	TYPE	COUNT	TYPE	COUNT	TYPE	COUNT	TYPE	COUNT	TYPE	COUNT
	SRB	21	DSP	22	SVC	10	I/O	3		

Legend:

- Trace table entry (TTE) type.
- Number of entries of this type present in the system trace buffers.

3. A data field that qualifies a particular entry type. Used primarily for SSCH, I/O, PGM, SVC, and SVCR entries to indicate the device number, program interrupt code, or SVC number associated with a particular entry.
4. Program-status word at the time that the trace entry was made.
5. Entry-dependent information.
6. Identification number of the central processor that created this trace entry.
7. ASID of the address space at the time that the trace entry was made.
8. Address of the TCB at the time that the trace entry was made.
9. Last eight digits of the TOD clock at the time that the trace entry was made.

Usage Note

The trace table usually contains thousands of entries. The TRTBL service can display many screens of output. To reduce the number of screens, use the address space operand.

TSULIST

The TSULIST service displays TSO session information. For active TSO users, the TSULIST service displays the following information:

- User ID
- Address space ID
- Line number
- Type of system used
- Terminal name

Syntax

where

<i>userid</i>	Is a TSO user ID.
<i>userid*</i>	Is a partial TSO user ID.

Examples

To display information about all TSO users currently logged on to the system, type

```

tsulist
      ①      ②      ③      ④      ⑤
AMTTS1I  USERID  ASID    LINE  SYS    NODE
AMTTS2I  PPG14      9      000   VTAM   RS3813
AMTTS2I  VMON1     11      000   VTAM   VAM/SPF
AMTTS2I  TSO1      17      000   VTAM   LSNAB05
AMTTS2I  CSG1      20      000   VTAM   L068
AMTTS2I  PPG10     48      000   VTAM   RS3814
AMTTS2I  TSO2      49      000   VTAM   LSNAC28
AMTTS2I  BTRAVIN   50      03D   TCAM   TK501
AMTTS2I  CPS21     54      000   VTAM   L074
AMTTS3I  8 USERS ARE LOGGED ON

```

Legend:

1. TSO user ID.
2. ASID (in decimal format).
3. Line number for TCAM; for VTAM, zeros are displayed.
4. TCAM or VTAM.
5. Terminal name.

To display information about TSO user TSO1, type

```

tsulist tso1
AMTTS1I  USERID  ASID    LINE  SYS    NODE
AMTTS2I  TSO1      17      000   VTAM   LSNAB05
AMTTS3I  8 USERS ARE LOGGED ON

```

To display information about TSO users whose user IDs begin with the letters TSO, type

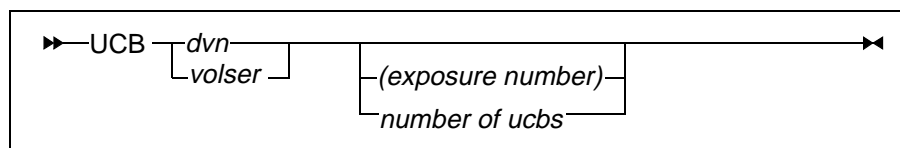

```

tsulist tso*
AMTTS1I  USERID  ASID    LINE  SYS    NODE
AMTTS2I  TSO1      17      000   VTAM   LSNAB05
AMTTS2I  TSO2      49      000   VTAM   LSNAC28
AMTTS3I  8 USERS ARE LOGGED ON

```

The UCB service displays a unit control block (UCB) in hexadecimal and character formats. In addition, important information contained in the UCB, such as device type, volume serial status, and path definition, is interpreted and presented in messages AMTU2AI, AMTU2BI, and AMTU2CI. You can specify either a device number or a volume serial number.

Syntax

where

<i>dvn</i>	Is the device number whose UCB you want to display.
<i>volser</i>	Is the volume serial number you want to display.
<i>number of ucbs</i>	Specifies the number of UCBs displayed, beginning with the specified device.

Example

To display the unit control block for volume serial number BAB320, type

```

ucb bab320          ①

AMTU2AI DVN=30B, Device class=DASD, Type=3390, Online, allocated ②
AMTU2BI Volser=BAB320, Status=Private, Shared ②
AMTU2CI Defined paths=2, Active paths=2, LCU No= 23 ②

AMTU21I UCB 30B RELOCATED PREFIX ③

```

Legend:

1. Specified device or volume serial number.
2. Interpreted information from UCB.
3. UCB relocated prefix section. The relocated prefix is a data area in the portion of the UCB prefix relocated above the 16 MB line.
4. UCB prefix section for the device.
5. UCB common section for the device.
6. UCB device-dependent section for the device. The length of this section is dependent upon the type of device represented by the UCB.
7. UCB common extension for this device. The length of this section is dependent upon the type of device represented by the UCB.
8. Address in hexadecimal format.
9. Offset from the origin in decimal and hexadecimal format.
10. Hexadecimal representation of data (eight bytes per line).
- ❶ Character representation of data (eight bytes per line).

USING

The USING (USI) service displays the active address spaces that are using a specified device. For example, if a tape drive appears inactive, you can determine which address space has allocated the device.

Syntax

where

<i>dvn</i>	Is the hexadecimal device number.
<i>volser</i>	Is a complete six-character volume serial number.
IN	Displays only the swapped-in address spaces using the device; the default.
ALL	Displays all the active address spaces using the device.

Example

To display the active address spaces using device BAB329, type

using BAB329

```
13:01:47 CMD=USING BAB329
      ①      ②      ③
AMTD29I Unit Job Name DDNAME Data Set Name
AMTD27I D3F MQMPASRK STEPLIB MQS12.BASE.LINKLIB
AMTD27I D3F MQMPASRK BBILOAD MQS12.BASE.LINKLIB
AMTD27I D3F MQMPASRK ISPPROF BITRKK.XDC2.ISPPROF
AMTD27I D3F DDH1X BBIPROF DDH1.BBPROF
AMTD27I D3F DDH1X IPCSDDIR IPCS.DDH1ESA.IPCSDDIR
AMTD27I D3F X18HGBG DFSOLP03 IMS.V5100.OLP03
AMTD27I D3F X18HGBG MATRIXB IMS.V5100.MATRIXB
AMTD27I D3F MMQJB120 STEPLIB MQS12.BASE.LINKLIB
AMTD27I D3F MMQJB120 BBILOAD MQS12.BASE.LINKLIB
AMTD27I D3F MMQJB120 DBGLIB BBM33.ENG.DBGLIB
AMTD27I D3F BMVSLK2 BBCLIB BB.XTSTH.BBCLIB
AMTD27I D3F BMVSLK2 BBIPROF BMVSLK.BMVSLK2.BBPROF
AMTD27I D3F AAOSSDHC BBIPARM DDH1.DH31.TRAVEL
AMTD27I D3F BOLGBG3 STEPLIB IPX11.BOLGBG.LOAD
```

Legend:

1. Job name.
2. DD name of the DD statement for the data set allocated to this device.
3. Data set name.

VIO

The VIO service displays usage of VIO slots by jobname or user ID.

Syntax

where

threshold Is a one- to four-digit integer; only address spaces that use a number of VIO slots greater than this value are listed; the default is 0.

Examples

To display the number of VIO slots used by each jobname or user ID, type

vio					
	①		②		
AMTVI1I	VMON1	HAS	2	VIO SLOT(S)	IN USE
AMTVI1I	SUP6	HAS	5	VIO SLOT(S)	IN USE
AMTVI1I	TESTJB2	HAS	12	VIO SLOT(S)	IN USE
AMTVI1I	VMON8	HAS	8	VIO SLOT(S)	IN USE
AMTVI1I	VMON9	HAS	2	VIO SLOT(S)	IN USE

Legend:

- 1. Job name or user ID.
- 2. Number of VIO slots used.

To display user IDs or jobnames using 45 or more VIO slots, type

vio 45			
AMTVI3I	NO JOBS USING	45	OR MORE VIO SLOT(S)

VMCMD

The VMCMD (VM) service lets an OS/390 user running as a VM guest issue CP commands through the virtual console interface.

Syntax

where

cpcmd Is any valid CP command. A pound sign (#) delimits multiple CP commands.

Example

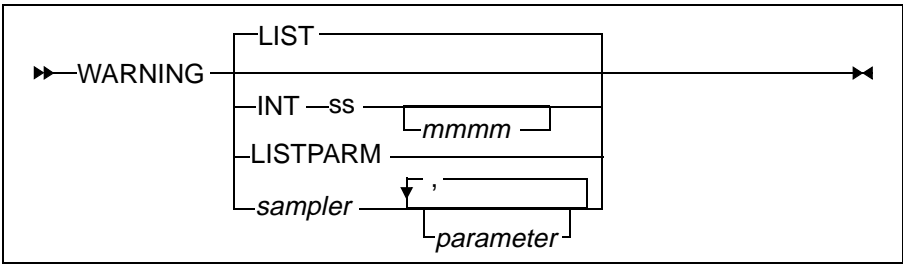

To enter the CP command Q NAMES, type

vmcmd q names

WARNING

The WARNING (WARN) service controls the operation of the Exception Monitor (formerly Advanced Early Warning Services or AEWS) system. This service also monitors activity in the system and issues warning messages when user-specified thresholds are exceeded.

Syntax

where

LIST	Lists the Exception Monitor samplers currently active; the default.
INT	Modifies the report interval and sample interval for all active samplers based on what you specify in the INT field: <ul style="list-style-type: none">• <i>ss</i>—is a value between 05 and 60.• <i>mmmm</i>—is a value between 100 and 1000.
LISTPARM	Lists the currently active samplers and the number of samples taken.
<i>sampler</i>	Lists the parameters currently in effect for that Exception Monitor sampler. A prompt is issued to allow you to modify these parameters, if desired.
<i>parameter</i>	Is a parameter associated with the specified Exception Monitor sampler. You only need to specify the minimum number of letters necessary to identify the parameter.

Examples

To list the active Exception Monitor samplers, type

```
aew list
```

```
AMTTH2I THE FOLLOWING PWS SAMPLERS ARE ACTIVE:
AMTTH3I GBLS      REP
```

To change the interval in effect for the REP sampler (if it is active), type

```
aew rep
```

```
AMTTL1I REP  PARAMETER VALUE(S):
AMTTL2I      INTERVAL = 1
AMTTL2I      TIME     = 1
AMTTH9I ENTER NEW VALUES, NEXT, LIST, OR END
int=5
AMTTH9I ENTER NEW VALUES, NEXT, LIST, OR END
end
```

To modify any or all parameters associated with an Exception Monitor sampler, type the values in the following format:

```
parameter=(value1,value2,...),parameter=(value1,value2,...),...
```

Note: When specifying a single value, parentheses are unnecessary.

To list a specific parameter for an Exception Monitor sampler, type the parameter name after the sampler name. Parameter names must be separated by commas. For example, to list only the INTERVAL and RPTNO parameter values for the BCPU sampler (if it is active), type

```
aew bcpu,i,r
```

```
AMTTL1I BCPU  PARAMETER VALUE(S):
AMTTL2I      INTERVAL = 1
AMTTL2I      RPTNO    = 5
AMTTH9I ENTER NEW VALUES, NEXT, LIST, OR END

end
```

Usage Note

When a parameter or parameters have been successfully modified, the message `ENTER NEW VALUES, LIST, OR END` reappears. You can suppress this prompt before it appears by typing **END** after the last new parameter value.

ZAP

The ZAP service modifies main storage.

Syntax

where

<i>hex_location</i>	Is the address field. This field must not exceed eight hexadecimal characters.
*	<p>Causes the ZAP service to modify the hexadecimal location used by the last invocation of the ZAP or DUMP service. The hexadecimal location that the ZAP service modifies becomes the current hexadecimal location.</p> <p>Optionally, the asterisk can be followed by an <i>offset</i>. When specified, an offset is a one- to four-digit hexadecimal value preceded by a plus or minus sign. This value indicates the relative distance from the beginning of the location defined by the asterisk to the area in storage to be displayed.</p>
<i>vvvvvvvv</i>	Is the Verify data field. You can change up to 6 bytes of data at a time. Specify the data in an even number of hexadecimal digits, from 2 to 12. You must verify all replaced data.
<i>rrrrrrrr</i>	Is the Replacement data field. You can change up to 6 bytes of data at a time. Specify the data in an even number of hexadecimal digits, from 2 to 12. The Replacement field must equal the Verify field in length. You must verify all replaced data.
<i>asname</i>	Is the address space name.
<i>(asid)</i>	Is the address space identifier in decimal format.
<i>(Xasid)</i>	Is the address space identifier in hexadecimal format.
@	Specifies your own address space; the default.
*	Specifies the last address space entered.

Example

To modify location 02F1C in the LLA address space from D2033008CA22 to 070007000700, type

```
zap 02f1c d2033008ca22 070007000700 11a
```

```
AMTZ2CI    REPLACE  SUCCESSFUL
```

Usage Notes

- You can omit the *asname* parameter if the hex location is in common storage (CSA, LPA, SQA, or the nucleus).
- Changes made using the ZAP service are effective only for the duration of the IPL. The ZAP service page-fixes changes to locations in the following areas:

EPLPA	Extended Pageable Link Pack Area
EMLPA	Extended Modifiable Link Pack Area
MLPA	Modifiable Link Pack Area
PLPA	Pageable Link Pack Area

Changes to locations are page-fixed by ZAP to prevent the changes from being overwritten when page-ins occur.

- For processor complexes consisting of more than one CPU, you can specify a CPU number. Add /*c* to the end of the value specified for *hex location*, where *c* is the single hexadecimal number (0 through 9) of a specific CPU. Use this field when you ZAP the Prefixed Save Area (PSA).

Chapter 5 Exception Monitor Samplers

This chapter provides detailed information about the Exception Monitor samplers, including proper syntax, required and optional parameters, and usage examples. It includes the following topics:

Sampler Name	Page
ACPU	5-4
AIO	5-6
AIOR	5-8
APAG	5-10
APGR	5-12

The Exception Monitor helps you detect potential problems by monitoring thresholds that you establish and sending a warning message when a threshold is exceeded. Messages can be sent to the system console in addition to the **WARN** view.

To access the Exception Monitors, follow these steps:

1. Access **SYSPROG** services from the OS/390, z/OS, and USS Solutions panel (or, on the **COMMAND** line, type **SYSPROG**).
2. Select the **WARNING** service.

Each sampler monitors a different aspect of system performance. You control the Exception Monitor by selecting samplers that are critical to your site, setting thresholds for them and then building a control statement member with those samplers.

For information on how to create a control statement member, see the *MAINVIEW Common Customization Guide*.

ACPU

The Address Space CPU (ACPU) sampler sends a warning message to the operator when an address space uses more than a specified percentage of CPU time during the reporting interval. You can suppress the message if a given threshold for total system CPU utilization is not reached during a reporting interval.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>name</i>	Is the name of the address space to be monitored. If the last character of the name is an asterisk (*), the name is to be treated as a generic address-space name prefix; that is, any address space whose name matches the character string up to but not including the asterisk is monitored.
<i>percent</i>	Is the CPU busy percentage for which an address space must be responsible before an exception message is issued for that address space.
<i>type</i>	Is the type of address space to be monitored, where <div><div>B</div>Indicates a batch job. <div>S</div>Indicates a started task. <div>T</div>Indicates a TSO user. <div>A</div>Indicates any address space matching the specified name; the default.</div>
<i>total cpu %</i>	Is the percentage of system CPU busy that must be reached before exception messages are issued. The default is a system CPU busy percent greater than 0.

Example

Assuming a report interval of 30 seconds, this control statement

```
acpu 4,*,35,a,50
```

displays warning messages at two-minute intervals if the system CPU-busy percentage exceeds 50 percent over the preceding two minutes. Also, a warning is issued for any address space that has been active 35 percent of the total CPU-busy time.

Warning Message

The following warning message is issued by the ACPU sampler:

```
PWSACPU0 WARNING* CPU USAGE IS ppp% FOR ttt jjjjjjjj
```

Message PWSACPU0 indicates that the specified address space has exceeded the warning threshold for percentage of system CPU-busy time, where

<i>ppp</i>	Is the address space busy percentage.
<i>ttt</i>	Is STC, TSU, or JOB.
<i>jjjjjjjj</i>	Is the address space name.

AIO

The Address Space I/O (AIO) sampler sends a warning message to the operator when an address space uses more than a specified percentage of the total system I/O activity during a reporting interval. You can suppress the message if a given total system I/O rate threshold is not reached during a reporting interval.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).								
<i>name</i>	Is the name of the address space to be monitored. If the last character of the name is an asterisk (*), the name is to be treated as a generic address-space name prefix; that is, any address space whose name matches the character string up to but not including the asterisk is monitored.								
<i>percent</i>	Is the percentage of total system I/O for which an address space must be responsible before an exception message is issued for that address space.								
<i>type</i>	Is the type of address space to be monitored, where <table data-bbox="688 1293 1338 1444"> <tr> <td>B</td><td>Indicates a batch job.</td></tr> <tr> <td>S</td><td>Indicates a started task.</td></tr> <tr> <td>T</td><td>Indicates a TSO user.</td></tr> <tr> <td>A</td><td>Indicates any address space matching the specified name; the default.</td></tr> </table>	B	Indicates a batch job.	S	Indicates a started task.	T	Indicates a TSO user.	A	Indicates any address space matching the specified name; the default.
B	Indicates a batch job.								
S	Indicates a started task.								
T	Indicates a TSO user.								
A	Indicates any address space matching the specified name; the default.								
<i>i/o rate</i>	Is the rate of EXCPs per second that must be reached before exception messages are issued. The default is a system I/O rate greater than 25 EXCPs per second.								

Example

Assuming a report interval of 30 seconds, this control statement

```
aio 4,*,35,a,50
```

displays warning messages at two-minute intervals if the system I/O rate exceeds 50 EXCPs-per-second over the preceding two minutes. Also, a warning is issued for any address space doing more than 35 percent of the I/O.

Warning Messages

The following warning messages are issued by the AIO sampler:

```
PWSAIO00 WARNING* TOTAL SYSTEM I/O RATE IS ppppp EXCPS/SEC
```

Message PWSAIO00 indicates that the system-I/O rate has exceeded the warning threshold.

```
PWSAIO01 WARNING* I/O RATE FOR ttt nnnnnnnn IS xxx% OF SYSTEM TOTAL
```

Message PWSAIO01 indicates that the specified address space has exceeded the warning threshold for percentage of system I/O, where

<i>ttt</i>	Is STC, TSU, or JOB.
<i>nnnnnnnn</i>	Is the address space name.
<i>xxx</i>	Is the percent of the total system I/O rate.

The Address Space I/O Rate (AIOR) sampler sends a warning message to the operator when an address space issues EXCPs at a rate that exceeds the defined threshold during a reporting interval.

Syntax

where

<i>interval</i>	Is the number of report intervals between warning messages.
<i>name</i>	Is the name of the address space to be monitored. If the last character of the name is an asterisk (*), the name is to be treated as a generic address-space name prefix; that is, any address space whose name matches the character string up to but not including the asterisk is monitored.
<i>i/o rate</i>	Is the rate of EXCPs-per-second that must be reached before exception messages are issued. The default is an I/O rate greater than 25 EXCPs per second.
<i>type</i>	Is the type of address space to be monitored, where B Indicates a batch job. S Indicates a started task. T Indicates a TSO user. A Indicates any address space matching the specified name; the default.

Example

Assuming a report interval of 30 seconds, this control statement

aior 4,*,25,a

displays warning messages at two-minute intervals for each address space whose I/O rate exceeds 25 EXCPs-per-second over the preceding two minutes.

Warning Message

The following warning message is issued by the AIOR sampler:

PWSAIR01 WARNING* I/O RATE FOR *ttt nnnnnnnn* IS *ppp* EXCPs/SEC

Message PWSAIR01 indicates that the specified address space has exceeded the warning threshold for I/O rate, where

<i>ttt</i>	Is STC, TSU, or JOB.
<i>nnnnnnnn</i>	Is the address space name.
<i>ppp</i>	Is the number of EXCPs per second.

The Address Space Paging (APAG) sampler sends a warning message to the operator when an address space uses more than a specified percentage of the total system paging activity during a reporting interval. You can suppress the message if a given total system paging-rate threshold is not reached during the reporting interval.

APAG ¹ _{intervals} *name* *percent* ^A _{type} ^{>25} _{paging rate}

where

intervals Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).

name Is the name of the address space to be monitored. If the last character of the name is an asterisk (*), the name is to be treated as a generic address-space name prefix; that is, any address space whose name matches the character string up to but not including the asterisk is monitored.

percent Is the percentage of total system paging for which an address space must be responsible before an exception message is issued for that address space.

<i>type</i>	Is the type of address space to be monitored, where
-------------	---

B Indicates a batch job.

S Indicates a started task.

T Indicates a TSO user.

A Indicates any address space matching the specified name; the default.

<i>paging rate</i>	Is the paging rate-per-second that must be reached before exception messages are issued. The default is a system paging rate greater than 25 pages per second.
--------------------	--

Example

Assuming a report interval of 30 seconds, this control statement

```
apag 4,*,35,a,50
```

displays warning messages at two-minute intervals if the system-paging rate exceeds 50 pages-per-second over the preceding two minutes. A warning is issued for any address space doing more than 35 percent of the paging.

Warning Messages

The following warning messages are issued by the APAG sampler:

```
PWSAPAG0 *WARNING* TOTAL SYSTEM PAGING RATE IS xxx PAGES/SEC
```

Message PWSAPAG0 indicates that the system-paging rate has exceeded the warning threshold.

```
PWSAPAG1 *WARNING* PAGING RATE FOR ttt nnnnnnnn IS xxx% OF SYSTEM TOTAL
```

Message PWSAPAG1 indicates that the specified address space has exceeded the warning threshold for percentage of system paging, where

<i>ttt</i>	Is STC, TSU, or JOB.
<i>nnnnnnnn</i>	Is the address space name.
<i>xxx</i>	Is the percentage of the total system paging rate.

APGR

The Address Space Paging Rate (APGR) sampler sends a warning message to the operator when an address space pages at an excessive rate during a reporting interval.

Syntax

where

<i>intervals</i>	Specifies the length in intervals of the sample period. The default sample period is 30 seconds (one interval).								
<i>name</i>	Is the name of the address space to be monitored. If the last character of the name is an asterisk (*), the name is to be treated as a generic address-space name prefix; that is, any address space whose name matches the character string up to but not including the asterisk is monitored.								
<i>paging rate</i>	Is the paging rate-per-second that must be reached by an address space before exception messages are issued. The default is an address-space paging rate greater than 10 pages per second.								
<i>type</i>	Is the type of address space to be monitored, where <table><tr><td>B</td><td>Indicates a batch job.</td></tr><tr><td>S</td><td>Indicates a started task.</td></tr><tr><td>T</td><td>Indicates a TSO user.</td></tr><tr><td>A</td><td>Indicates any address space matching the specified name; the default.</td></tr></table>	B	Indicates a batch job.	S	Indicates a started task.	T	Indicates a TSO user.	A	Indicates any address space matching the specified name; the default.
B	Indicates a batch job.								
S	Indicates a started task.								
T	Indicates a TSO user.								
A	Indicates any address space matching the specified name; the default.								

Example

Assuming a report interval of 30 seconds, this control statement

```
apgr 4,*,35,a
```

displays warning messages at two-minute intervals if any address-space paging rate exceeds 35 pages-per-second over the preceding two minutes.

Warning Message

The following warning message is issued by the APGR sampler:

```
PWSAPGR1 WARNING* PAGING RATE FOR ttt nnnnnnnn IS ppp PAGES/SEC
```

Message PWSAPGR1 indicates that the specified address space has exceeded the warning threshold for percentage of system paging, where

<i>ttt</i>	Is STC, TSU, or JOB.
<i>nnnnnnnn</i>	Is the address space name.
<i>ppp</i>	Is the number of pages per second.

ASRV

The Address Space Service Rate Percentage (ASRV) sampler sends a warning message to the operator when an address space uses more than the specified percentage of one or more SRM service component resources during a reporting interval. The message can be suppressed if a given total system service rate threshold is not reached during the reporting interval.

Syntax

where

intervals Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).

name Is the name of the address space to be monitored. If the last character of the name is an asterisk (*), the name is to be treated as a generic address-space name prefix; that is, any address space whose name matches the character string up to but not including the asterisk is monitored.

percent Is the percentage of the total system service rate that an address space must be responsible for before an exception message is issued for that address space.

type Is the type of address space to be monitored, where

B	Indicates a batch job.
S	Indicates a started task.
T	Indicates a TSO user.
A	Indicates any address space matching the specified name; the default.

measure Specifies the SRM component use rate to be monitored:

C	CPU service units
I	I/O service units
M	MSO service units
T	total service units; the default

service rate Is the system SRM-resource service rate (in service units per second) that must be reached before exception messages are issued. The default is a system service rate greater than zero SUs per second.

Example

Assuming a report interval of 30 seconds, this control statement

```
asrv 4,*,35,a,t,50
```

displays warning messages at two-minute intervals whenever an address space being monitored uses more than the 35 percent of total SRM service components during a given reporting interval. You can suppress a message if a given total system service rate threshold of 50 is not reached during a reporting interval.

Warning Messages

The following warning messages are issued by the ASRV sampler:

```
PWSASRV0 WARNING* ADDR SPACE mmm SERVICE RATE IS sssss SU/SEC
```

Message PWSASRV0 indicates that the system service-rate has exceeded the warning threshold, where

<i>mmm</i>	Is the SRM service component being monitored.
<i>sssss</i>	Is the number of service units.

```
PWSASRV1 WARNING* mmm SERVICE RATE FOR ttt jjjjjjjj IS ppp% OF SYSTEM TOTAL
```

Message PWSASRV1 indicates that the specified address space has exceeded the warning threshold for percentage of system SRM component utilization, where

<i>mmm</i>	Is the SRM service component being monitored.
<i>ttt</i>	Is STC, TSU, or JOB.
<i>jjjjjjjj</i>	Is the address space name.
<i>ppp</i>	Is the address space SRM component used as a percentage of system total.

The Address Space Service Unit Rate (ASSR) sampler sends a warning message to the operator when an address space uses SRM service components at a rate that exceeds the defined threshold during a reporting interval. The message can be suppressed if a given total system-service rate threshold is not reached during a reporting interval.

Syntax

where

<i>interval</i>	Is the number of report intervals between warning messages.
<i>name</i>	Is the name of the address space to be monitored. If the last character of the name is an asterisk (*), the name is to be treated as a generic address-space name prefix; that is, any address space whose name matches the character string up to but not including the asterisk is monitored.
<i>rate</i>	Is the SRM component service rate for an address space that must be reached before exception messages are issued. The default is a system service rate greater than zero SUs per second.
<i>type</i>	Is the type of address space to be monitored, where B Indicates a batch job. S Indicates a started task. T Indicates a TSO user. A Indicates any address space matching the specified name; the default.
<i>measure</i>	Specifies the SRM service measure to be monitored: C CPU service I I/O service M MSO service T total service; the default

Example

Assuming an interval of 30 seconds, this control statement

```
assr 4,*,100,a,t
```

displays warning messages at two-minute intervals whenever any address space uses more than a total of 100 SRM service units during a given reporting interval.

Warning Message

The following warning message is issued by the ASSR sampler:

```
PWSASSR1 WARNING* mmm SERVICE RATE FOR ttt jjjjjjjj IS rrrrr SU/SEC
```

Message PWSASSR1 indicates that the address-space service-unit rate has exceeded the warning threshold, where

<i>mmm</i>	Is the SRM service component being monitored.
<i>ttt</i>	Is STC, TSU, or JOB.
<i>jjjjjjjj</i>	Is the address space name.
<i>rrrrr</i>	Is the number of service units.

ASVT

The ASVT sampler displays a warning message if the percentage of slots on any of the three queues is less than the specified threshold value.

When programs that establish PCs terminate, the address space ID is not reusable until all address spaces that had established a cross-system bind with the address space terminate. When this occurs, a slot is taken off of the Non-reusable Replacement Queue to maintain the MAXUSER value. Once the Non-reusable Replacement Queue is depleted, the maximum number of address spaces (number on the available queue plus the number active) is decreased each time an address space becomes not-reusable. Eventually, the Available Queue might be depleted, preventing the start of additional address spaces. The only exception is that started tasks can be initiated as long as the Start/SASI Queue is not depleted. Depletion of these queues might force a system IPL. Therefore, monitoring the queues might give you an opportunity to take corrective action to avoid an IPL.

Syntax

where

<i>intervals</i>	Specifies the length of the report period in intervals. The default is 30 seconds (one interval).
<i>avq</i>	Is the threshold percentage for the Available Queue. A warning message is displayed when the number of slots on the Available Queue, taken as a percentage of the original number, is less than the specified threshold value.
<i>rplq</i>	Is the threshold percentage for the Non-reusable Replacement Queue. A warning message is displayed when the number of slots on the Non-reusable Replacement Queue, taken as a percentage of the original number, is less than the specified threshold value.
<i>strtq</i>	Is the threshold percentage for the Start/SASI Queue. A warning message is displayed when the number of slots on the Start/SASI Queue, taken as a percentage of the original number, is less than the specified threshold value.

Example

ASVT, 4, 20, 50, 80

The reporting period is four intervals (two minutes if the default interval is used). A warning message will be issued if one of the following occurs:

- Available Queue is less than 20% of the USERMAX value
- Non-reusable Replacement Queue is less than 50% of the RSVNONR value
- Start/SASI Queue is less than 80% of the RSVSTRT value specified when the system was IPL'd.

BCPU

The Batch CPU (BCPU) sampler sends a warning message to the operator when a batch address space uses more than a specified percentage of the total CPU time during a reporting interval. The message can be suppressed if a given threshold for total CPU usage is not reached during the reporting interval.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>percent</i>	Is the percentage of total system CPU time that a batch address space must be responsible for before an exception message is issued for that address space.
<i>rptno</i>	Is the maximum number of address spaces to be listed whenever a CPU overload condition is detected. The default is 5.
<i>total cpu %</i>	Is the CPU busy percentage that must be reached before exception messages are issued. The default is a system CPU busy percentage greater than zero.

Example

Assuming a report interval of 30 seconds, this control statement

```
bcpu 4,35,5,5
```

displays up to five warning messages at two-minute intervals if the system-CPU busy percentage exceeds 50 percent over the preceding two minutes. A warning is issued for any batch address space that has been active 35 percent of the total CPU busy time.

Warning Message

The following warning message is issued by the BCPU sampler:

```
PWSBCPU1 WARNING* CPU USAGE IS ppp% FOR JOB jjjjjjjj
```

Message PWSBCPU1 indicates that the specified address space has exceeded the warning threshold for percentage of system-CPU busy time, where

ppp Is the address space busy percentage.

jjjjjjjj Is the address space name.

BIO

The Batch I/O (BIO) sampler sends a warning message to the operator when a batch address space uses more than a specified percentage of the total system I/O activity during a reporting interval. The message can be suppressed if a given total system I/O rate threshold is not reached during a reporting interval.

Syntax

where

<i>intervals</i>	Specifies the length in intervals of the sample period. The default sample period is 30 seconds (one interval).
<i>percent</i>	Is the percentage of total system I/O that a batch address space must be responsible for before an exception message is issued for that address space.
<i>rptno</i>	Is the maximum number of batch address spaces to be listed whenever a batch I/O overload condition is detected.
<i>i/o rate</i>	Is the number of EXCPs-per-second that must be reached before exception messages are issued. The default is a system I/O rate greater than 25 EXCPs per second.

Example

Assuming a report interval of 30 seconds, this control statement

```
bio 4,25,5,50
```

displays warning messages at two-minute intervals if the system I/O rate exceeds 50 EXCPs-per-second over the preceding two minutes. A warning is issued for any batch address space doing more than 25 percent of the I/O.

Warning Messages

The following warning messages are issued by the BIO sampler:

PWSBIO00 WARNING* TOTAL SYSTEM I/O RATE IS xxx EXCPS/SEC

Message PWSBIO00 indicates that the system-I/O rate has exceeded the warning threshold.

PWSBIO01 WARNING* I/O RATE FOR JOB *nnnnnnnn* IS *xxx*% OF SYSTEM TOTAL

Message PWSBIO01 indicates that the specified address space has exceeded the warning threshold for percentage of system I/O, where

nnnnnnnn Is the address space name.

xxx Is the percent of the total system I/O rate.

BPAG

The Batch Paging (BPAG) sampler sends a warning message to the operator when a batch address space uses more than a specified percentage of the total system paging activity during a reporting interval. The message can be suppressed if a given threshold for the total system paging rate is not reached during the reporting interval.

Syntax

where

<i>intervals</i>	Specifies the length in intervals of the sample period. The default sample period is 30 seconds (one interval).
<i>percent</i>	Is the percentage of total system paging that a batch address space must be responsible for before an exception message is issued for that address space.
<i>rptno</i>	Is the maximum number of batch address spaces to be listed whenever a batch paging overload condition is detected.
<i>paging rate</i>	Is the paging rate-per-second that must be reached before exception messages are issued. The default is a system paging rate greater than 25 pages per second.

Example

Assuming a report interval of 30 seconds, this control statement

```
bpag 4,25,5,50
```

displays warning messages at two-minute intervals if the system paging rate exceeds 50 pages-per-second over the preceding two minutes. A warning is issued for any batch address space doing more than 25 percent of the paging.

Warning Messages

The following warning messages are issued by the BPAG sampler:

PWSBPAG0 WARNING* TOTAL SYSTEM-PAGING RATE IS NOW *ppp* PAGES/SEC

Message PWSBPAG0 indicates that the system paging rate has exceeded the warning threshold.

PWSBPAG1 WARNING* PAGING RATE FOR JOB *nnnnnnnn* IS *xxx*% OF TOTAL SYSTEM PAGING

Message PWSBPAG1 indicates that the specified address space has exceeded the warning threshold for percentage of system paging, where

nnnnnnnn Is the address space name.

xxx Is the percent of total system paging rate.

BSRV

The Batch Service (BSRV) sampler sends a warning message to the operator when a batch address space uses more than the specified percentage of one or more SRM service measures during a reporting interval. You can suppress the message if a given total system service-rate threshold is not reached during the reporting interval.

Syntax

where

<i>intervals</i>	Specifies the length in intervals of the sample period. The default sample period is 30 seconds (one interval).
<i>percent</i>	Is the percentage of total system SRM component utilization for which an address space is responsible. This total must be exceeded before an exception message is issued for that address space.
<i>measure</i>	Specifies the SRM service measure to be monitored: C CPU service units I I/O service units M MSO service units T total service units; the default
<i>rptno</i>	Is the maximum number of address spaces to be listed whenever a batch service overload condition is detected. The default is 5.
<i>service rate</i>	Is the system SRM service-consumption rate that must be reached before exception messages are issued. The default is a system service rate greater than zero SUs per second.

Example

Assuming a report interval of 30 seconds, this control statement

```
bsrv 4,35,t,5,509
```

displays up to five warning messages at two-minute intervals whenever an address space being monitored uses more than the 35 percent of total SRM components service during a given reporting interval. You can suppress the message if a given total system service rate threshold of 50 is not reached during a reporting interval.

Warning Messages

The following warning messages are issued by the BSRV sampler:

```
PWSBSRV0 WARNING* ADDR SPACE mmm SERVICE RATE IS sssss SU/SEC
```

Message PWSBSRV0 indicates that the system paging rate has exceeded the warning threshold, where

<i>mmm</i>	Is the SRM service component being monitored.
<i>sssss</i>	Is the number of service units per second.

```
PWSBSRV1 WARNING* mmm SERVICE RATE FOR JOB jjjjjjjj IS ppp% OF SYSTEM TOTAL
```

Message PWSBSRV1 indicates that the specified address space has exceeded the warning threshold for percentage of system SRM component utilization, where

<i>mmm</i>	Is the SRM service component being monitored.
<i>jjjjjjjj</i>	Is the address space name.
<i>ppp</i>	Is the address space SRM component use as a percentage of the system total.

CHA

The Channel (CHA) sampler monitors channel-path usage and sends a warning message to the operator when a channel path exceeds the defined utilization-percentage threshold.

Syntax

where

<i>intervals</i>	Specifies the length in intervals of the sample period. The default sample period is 30 seconds (one interval).
<i>threshold</i>	Is the average utilization high threshold (0-100 percent).
<i>chpid1</i>	Is the lowest path number in the range of channel paths to be monitored; must be two digits.
<i>chpid2</i>	Is the highest path number in the range of channel paths to be monitored; must be two digits.

Note: Parameters *chpid1* and *chpid2* are optional. If they are omitted, all channel paths are monitored.

Example 1

Assuming a report interval of 30 seconds, this control statement

```
cha 2,35,01,10
```

displays warning messages at one-minute intervals if any channel path in the range 01 through 10 exceeds 35 percent utilization.

Example 2

Assuming a report interval of 30 seconds, this control statement

```
cha 1,40
```

displays warning messages at 30-second intervals if any channel path utilization exceeds 40 percent.

Warning Message

The following warning message is issued by the CHA sampler:

```
PWSCHA01 WARNING* CHANNEL xx ON CPU y UTILIZATION IS zz%
```

where

<i>xx</i>	Is the physical channel number (0 to 15).
<i>y</i>	Is the CPU number (0 or 1).
<i>zz</i>	Is the percent utilization.

CPU

The CPU Utilization (CPU) sampler monitors CPU usage by system, by TSO, and by individual jobs.

Note: PR/SM time-slicing distorts the CPU utilization observed by the CPU sampler. Consider using the PCPU and XCPU samplers in a PR/SM environment.

Syntax

where

<i>intervals</i>	Specifies the length in intervals of the sample period. The default sample period is 30 seconds (one interval).
CPXLIMIT= <i>nn</i>	Provides the ability to establish warning thresholds (in percent) for each CPU in a multiprocessor system. A warning message will be issued when the average CPU utilization for the specified CPUs exceeds the threshold values during the interval. Valid values are 0-99. A value of zero (the default) indicates that no warning should be issued. Values are positional and correspond to CPU0 through CPU15 inclusive. Multiple values must be enclosed in parentheses and separated by commas.
CPULIMIT= <i>nn</i>	Is the average CPU utilization for all CPUs in a multiprocessor system that causes a warning message to be issued. Specify two digits.
TSOLIMIT= <i>nn</i>	Is the percent CPU utilization by TSO users that causes a warning message to be issued. Specify two digits.
JOBLIMIT= <i>nn</i>	Is the percent CPU utilization by individual jobs, TSO users, or started tasks that causes a warning message to be issued. Specify two digits.

Note: If you omit a threshold specification or specify zero, no warning messages are produced.

Example

Assuming a report interval of 30 seconds, this control statement

```
cpu 10,cpxlimit=99,tsolimit=50,joblimit=20
```

displays warning messages at five-minute intervals if CPU0 usage exceeds 99 percent, TSO usage exceeds 50 percent, or any job uses more than 20 percent of the CPU.

Warning Messages

The following warning messages are issued by the CPU sampler:

```
PWSCPU00 WARNING* CPUx USAGE IS xxx%
```

Message PWSCPU00 indicates that the utilization of CPUx exceeds the warning threshold.

```
PWSCPU01 WARNING* CPU COMPLEX USAGE IS xxx
```

Message PWSCPU01 indicates that the average CPU usage for all CPUs in the complex exceeds the warning threshold.

```
PWSCPU02 WARNING* CPU USAGE IS xxx% FOR TSO
```

Message PWSCPU02 indicates that the total CPU usage by TSO users exceeds the warning threshold.

```
PWSCPU03 WARNING* CPU USAGE IS nn% FOR aaa xxxxxxxx
```

Message PWSCPU03 indicates that the CPU usage of address space name xxxxxxxx exceeds the warning threshold. The value *aaa* can be JOB, TSU, or STC.

```
PWSCPU90 PARAMETER xxxxxxxx INVALID FOR CPU SERVICE
```

Message PWSCPU90 indicates that parameter xxxxxxxx contains invalid data.

CQD

The CPU Queue Depth (CQD) sampler monitors the CPU active task queue. It also sends a warning message to the operator when the average queue depth of active tasks (both those in memory and those ready for dispatching) exceeds a threshold you specify.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>depth</i>	Is the threshold count of active tasks waiting.

Example

Assuming a report interval of 30 seconds, this control statement

```
cqd 1,10
```

displays warning messages at 30-second intervals if the average CPU queue depth exceeds 10.

Warning Message

The following warning message is issued by the CQD sampler:

```
PWSCQD01 WARNING* CPU QUEUE DEPTH IS xxx
```

Message PWSCQD01 indicates that *xxx* is the average number of active tasks waiting.

CSA

The CSA and SQA Utilization (CSA) sampler monitors CSA usage and system-defined critical thresholds for SQA usage, and anticipates problems caused by CSA or SQA usage that exceeds the thresholds.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>threshold</i>	Is the percent utilization of CSA that causes a warning message to be issued.

Note: If you omit a threshold specification or specify zero, no warning messages are produced.

Example

Assuming a report interval of 30 seconds, this control statement

```
csa 1,80
```

displays a warning message at 30-second intervals whenever CSA utilization exceeds 80 percent.

Warning Messages

The following warning messages are issued by the CSA sampler:

```
PWSCSA01 WARNING* CSA|ECSA USAGE IS xxx%; yyyyK ARE FREE
```

Message PWSCSA01 indicates that CSA or ECSA usage exceeds the specified threshold; yyyy represents the number of kilobytes of CSA still available.

```
PWSCSA02 WARNING* SQA CRITICAL THRESHOLD EXCEEDED
```

Message PWSCSA02 indicates that SQA utilization has exceeded a critical level.

```
PWSCSA03 WARNING* SQA APPROACHING CRITICAL LEVEL
```

Message PWSCSA03 indicates that SQA utilization is reaching a critical level.

```
PWSCSA90 SPECIFIED THRESHOLD GREATER THAN 100%
```

Message PWSCSA90 indicates that the CSA control statement was rejected because the specified threshold is invalid.

CSMJ

The CSMJ sampler monitors the percentage of common storage use by jobnames and sends a warning message to the operator for each job that meets or exceeds the specified thresholds. This allows the operator to take action before a common storage shortage adversely affects the entire system. The thresholds represent the percent of total available common storage (CSA, ECSA, SQA, or ESQA) that has been allocated by any single jobname.

Global thresholds apply to all jobs except *MASTER* and *SYSTEM*. The default global thresholds are 3% for CSA and SQA, and 2% for ECSA and ESQA.

The master address space (*MASTER*) and storage attributed to the system (SYSTEM*) will be checked only when specified limits are provided for these names.

You can specify threshold overrides for specific jobnames. Address spaces that can allocate large amounts of common storage (such as JES2, IMS, and DB2) should have their jobnames specified and their threshold values raised accordingly, which prevents the issuance of multiple warning messages.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>t1</i>	Is the percent allocation of CSA by any jobname that causes a warning message to be issued.
<i>t2</i>	Is the percent allocation of ECSA by any jobname that causes a warning message to be issued.
<i>t3</i>	Is the percent allocation of SQA by any jobname that causes a warning message to be issued.
<i>t4</i>	Is the percent allocation of ESQA by any jobname that causes a warning message to be issued.

jobn Is a jobname followed by four threshold values that apply only to that specific jobname; up to 32 job or threshold values can be specified.

Note: To monitor all jobs, use *SYSTEM* as the jobname.

Example

Assuming a report interval of 30 seconds, this control statement

```
csmj 3,2,3,2,  
    *master*,4,3,4,3
```

displays a warning message at 30-second intervals whenever any job has allocated more than the global thresholds, or for jobname *MASTER*, whenever it has allocated more than four percent of CSA or SQA and more than three percent of ECSA or ESQA.

Note: Control statements ending with a comma (,) indicate that the statement is continued on the next input line. Continuation lines must be indented if the jobname has an asterisk as the first character.

Warning Messages

The following warning messages are issued by the CSMJ sampler:

PWSCSM01 *WARNING* xxxxxxxx yyyy HAS ALLOCATED nn% OF zzzz

Message PWSCSM01 indicates that jobname xxxxxxxx in ASID yyyy has allocated nn percent of available common storage. The common storage area (CSA, ECSA, SQA, or ESQA) is indicated by zzzz.

PWSCSM02 *WARNING* FAILURE EXTRACTING CS MONITOR DATA

Message PWSCSM02 indicates that an error has occurred in the COMMON STORAGE MONITOR component of BBXS. Contact BMC Software Customer Support.

PWSCSM03 *WARNING* CS MONITOR IS NOT ACTIVE

Message PWSCSM03 indicates that COMMON STORAGE MONITOR must be active to use the CSMJ sampler. Refer to the *MAINVIEW® for OS/390 User Guide and Reference* for information about starting the COMMON STORAGE MONITOR.

PWSCSM04 *WARNING* BBXS LEVEL DOES NOT SUPPORT CS MONITOR

Message PWSCSM04 indicates that the active BBX subsystem is not at the required level to support COMMON STORAGE MONITOR. Ensure that current maintenance has been applied to FMID BBBBX16. An IPL or execution of the BBXSINIT batch job is required to activate the new level of BBXS after applying maintenance.

PWSCSM05 *WARNING* BBXS IS NOT ACTIVE

Message PWSCSM05 indicates that BBXS must be active to use the CSMJ sampler. BBXS is started automatically when MAINVIEW for OS/390 is activated. Contact BMC Software Customer Support.

DEV

The Device Busy (DEV) sampler monitors the amount of activity on either a single device or a range of device addresses and identifies excessive contention for devices.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>threshold</i>	Is the threshold percentage for device utilization. A warning message is issued for each device in the range whose percent busy exceeds this threshold.
<i>dvn</i>	Is a device number. The device number does not have to be assigned to a specific device at the time you invoke the sampler. When the device number is assigned to a specific device, monitoring begins at that point.
<i>dvn1-dvn2</i>	Is a range of device numbers; <i>dvn1</i> is the lowest device number and <i>dvn2</i> is the highest device number.

Note: You can have up to 16 DEV samplers, each with different thresholds, active at one time, just as long as the device numbers do not overlap.

Example

Assuming a report interval of 30 seconds, this control statement

```
dev 10,20,150,154
```

displays a warning message at five-minute intervals when any device in range 150 through 154 is more than 20 percent busy over the five-minute interval. A separate message is issued for each device that exceeds the 20 percent threshold.

Warning Message

The following warning message is issued by the DEV sampler:

```
PWSDEV01 WARNING* DEVICE dvn (vvvvvv) USAGE IS xxx%
```

Message PWSDEV01 indicates that the utilization of device *dvn* exceeds the warning threshold. For disk and tape devices, the volume serial is also displayed.

DIOQ

The DASD I/O Queue (DIOQ) sampler displays information for a DASD device when the number of I/Os queued to the device equals or exceeds the specified queue depth.

Syntax

where

<i>intervals</i>	Is the number of intervals between report periods; the default report period is 30 seconds (one interval).
<i>depth</i>	Is the queue depth necessary for the device to be reported. For example, if you specify 3, all DASD devices with three or more queued requests are reported. The minimum value is 1 and the maximum is 999; the default is 5.

Example

Assuming a report interval of 30 seconds, this control statement

```
dioq 4,3
```

displays warning messages at two-minute intervals if the I/O Queue depth is greater than or equal to 3.

Warning Message

The following message is issued by the DIOQ sampler:

```
PWSDIOQ0 *WARNING* Q=qqq nnnn aaa volser s mmm jobname PENDING
```

Message PWSDIOQ0 indicates that the I/O Queue depth has exceeded the warning threshold, where

<i>qqq</i>	Is the I/O queue depth for the DASD device.
<i>nnnn</i>	Is the device type.
<i>aaa</i>	Is the device address.
<i>volser</i>	Is the volume serial number.
<i>s</i>	Is the special status indicator. The letter P indicates that the device contains an active paging data set. The letter R indicates that the device is currently reserved.
<i>mmm</i>	Is the mount attribute for the volume.
<i>jobname</i>	Is the jobname for the job with I/O in progress at the time that the device was checked.
PENDING	If present, indicates that I/O has been started for the device but has not completed. This indicator can signal a problem, such as the device is reserved by another system. However, this is a normal condition for paging and other applications that use command chaining to continue a single I/O.

DNR

The Device Not Ready (DNR) sampler monitors tape and DASD devices online but not ready and notifies the operator when online devices have been not ready for more than a specified interval.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>notready</i>	Is the number of minutes a device must remain not ready for a warning message to be issued.

Example

Assuming a report interval of 30 seconds, this control statement

```
dnr 4,2
```

displays warning messages at two-minute intervals for each device that has been online but not ready for over two minutes.

Warning Message

The following warning message is issued by the DNR sampler:

```
PWSDNR01 WARNING* DEVICE nnn (vvvvvv) NOT READY FOR xx MIN
```

Message PWSDNR01 indicates that device *nnn* has been online but not ready for a period of time that exceeds the warning threshold.

Note: A blank volume serial number appears when volume rollover occurs.

DOM

The Domain Overload (DOM) sampler monitors domains for overloading and notifies the operator if, over a sampling interval, any domain's average multiprogramming level (MPL) exceeds its target MPL.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>percent</i>	Is the threshold percentage of samples in which the average MPL exceeds the target MPL, causing a warning message to be issued.

Example

Assuming a report interval of 30 seconds, this control statement

```
dom 2,50
```

displays warning messages at one-minute intervals if 50 percent or more of the samples indicate that the average MPL exceeds the target MPL.

Warning Message

The following warning message is issued by the DOM sampler:

```
PWSDOM01 WARNING* DOMAIN nnn OVERLOAD IS xxx%
```

where

nnn Is the domain number.

xxx Is the percentage of sample indicating overloading.

DVTN

The DVTN sampler displays deviation from a list of jobs that must be active during specified time intervals and notifies you when a job that should be active is not. This list of jobs resides in a CONFIG_{xx} member of SYS1.PARMLIB.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
00	Is the default suffix of the CONFIG _{xx} member.
xx	Is the suffix of the CONFIG _{xx} member in SYS1.PARMLIB that is to be used.

The entries in the CONFIG_{xx} member must begin in column 1. The format of the entries is

`*/NAME=jobname TIME=hhmm-hhmm ACT=command`

where

<i>jobname</i>	Is the jobname (or started task ID for started tasks).
<i>hhmm-hhmm</i>	Are the beginning and ending times for the interval that the specified job must be active. A beginning value of four zeros (0000- <i>hhmm</i>) indicates that the job should ALWAYS be active. <ul style="list-style-type: none">Valid values for <i>hh</i> are 00 to 23Valid values for <i>mm</i> are 00 to 59
<i>command</i>	Is an optional field that you can substitute with any OS/390 command. The command is executed if the targeted job is not active during the specified time interval. When ACT is specified, <i>command</i> cannot be blank.

Example

Assuming a report interval of 30 seconds, this control statement

```
dvtn 10,00
```

displays a warning message at five-minute intervals if the jobs in CONFIG00 are not executing.

Warning Message

The following warning message is issued by the DVTN sampler:

```
PWSDV8I WARNING as_name SHOULD BE ACTIVE hhmm-hhmm
```

Message PWSDV8I indicates that the listed address space is not active during the indicated shift. You should correct the operational status of the address space.

ENQ

The Enqueue Conflicts (ENQ) sampler monitors enqueue conflicts and notifies the operator when jobs have been waiting for enqueued resources for more than a specified interval.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>waiting</i>	Is the number of minutes that an enqueue conflict must exist for a warning message to be issued.

Example

Assuming a report interval of 30 seconds, this control statement

```
enq 4,5
```

displays warning messages at two-minute intervals if any enqueue conflicts have existed for over five minutes.

Warning Message

The following warning message is issued by the ENQ sampler:

PWSENQ01 WARNING* ENQUEUE CONFLICT(S) PRESENT OVER xxx MIN

Message PWSENQ01 indicates that one or more jobs have been waiting for resources for longer than the specified threshold. To display the enqueue situation, use service ENQUEUEES.

FIX

The Fixed Pages (FIX) sampler monitors page fixing in the system and notifies the operator if the number of fixed pages in the system, including the nucleus and SQA, exceeds a user-specified threshold.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>k</i>	Is the threshold maximum amount of page-fixed memory in units of 1024 bytes (K).

Example

Assuming a report interval of 30 seconds, this control statement

```
fix 2,1000
```

displays warning messages at one-minute intervals if there are pages fixed in excess of 1000 KB of memory.

Warning Message

The following warning message is issued by the FIX sampler:

```
WSFIX01 WARNING* PAGE FIXED MEMORY = xxxxxK
```

where

xxxxx Is the number of K fixed in the system.

INT

The Interval (INT) service changes the reporting base interval and the DIE sample interval. For each sampler, you can specify a multiple of the report base interval in the interval parameter of the control statement.

Syntax

```

▶▶—INT —report interval —sample interval —————▶▶

```

where

<i>report interval</i>	Is the interval between report phases in seconds. The range is from 5 to 60 seconds; the default is 30 seconds.
<i>sample interval</i>	Is the interval between DIE samples in milliseconds. The range is from 100 to 1000 milliseconds; the default is CPU-model dependent:
263ms	3081, 3084
511ms	3083, 4381, all others

Example

To set a report interval of 60 seconds and a sample interval of 1000 milliseconds, place this control statement in BBPARM library member PWSCPMxx:

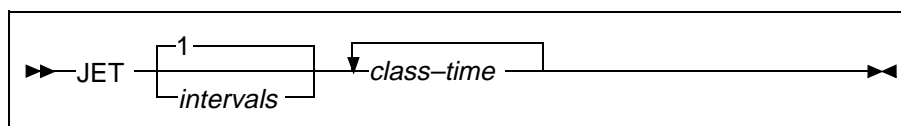

```
int 60,1000
```

The base interval between report phases is 60 seconds. The system is sampled under the DIE once every 1000 milliseconds (one second).

JET

The Job Elapsed Time (JET) sampler monitors the elapsed time of jobs and notifies the operator if any job exceeds a user-specified interval. The threshold interval is specified by job class. The sampler can also be used to enforce installation standards relating job class to duration.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>class</i>	Is the job class to be monitored (A through Z and 0 through 9).
<i>time</i>	Is the threshold elapsed time in minutes.

Note: You can specify up to eight pairs of job class and time.

Example

Assuming a report interval of 30 seconds, this control statement

```
jet 4,a,5
```

displays warning messages at two-minute intervals for every job running in Class A for longer than five minutes.

Note: JES3 job classes are not supported.

Warning Messages

The following warning messages are issued by the JET sampler:

PWSJET01 WARNING* CLASS *n* JOB *jjjjjjjj* RUNNING FOR *xxx* MINUTES

where

<i>n</i>	Is the job class.
<i>jjjjjjjj</i>	Is the jobname.
<i>xxx</i>	Is the elapsed time in minutes.

PWSJET02 WARNING* CLASS *n* JOB *nnnnnn* *jjjjjjjj* EXECUTING *xxx* MINUTES

where

<i>n</i>	Is the job class.
<i>nnnnnn</i>	Is the JES2 job number.
<i>jjjjjjjj</i>	Is the jobname.
<i>xxx</i>	Is the elapsed time in minutes.

JSU

The Job Storage Usage—Real & Auxiliary (JSU) sampler monitors all jobs' usage of ASM slots and real frames, and identifies jobs that are overusing real storage and allocated slots of auxiliary storage.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval). You can specify up to 99.
<i>frames</i>	Is the maximum number of frames that can be held by a job (real storage) before a message is issued. You can specify up to 99999.
<i>slots</i>	Is the maximum number of slots that can be held by a single job (auxiliary storage) before a message is issued. You can specify up to 99999.

Note: If you omit a threshold specification or specify zero, no warning message is issued.

Examples

Assuming a report interval of 30 seconds, this control statement

```
jsu 10,100,200
```

displays warning messages every five minutes for each job that holds more than

- 200 slots
- 100 frames

Warning Messages

The following warning messages are issued by the JSU sampler:

PWSJSU01 WARNING* JOB *jjjjjjjj* HOLDS *xxx* FRAMES

where

jjjjjjjj Is the jobname.

xxx Is the count of frames held.

PWSJSU02 WARNING* JOB *jjjjjjjj* HOLDS *yyy* SLOTS

where

jjjjjjjj Is the jobname.

yyy Is the count of slots held.

JVR

The Job Awaiting V=R Region (JVR) sampler monitors jobs awaiting a V=R region and notifies the operator if any job is waiting for a V=R region.

Syntax

where

intervals Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).

Example

Assuming a report interval of 30 seconds, this control statement

```
jvr 10
```

displays warning messages at five-minute intervals for each job waiting for a V=R region.

Warning Messages

The following warning messages are issued by the JVR sampler:

```
PWSJVR01 WARNING* JOB jjjjjjjj WAITING FOR V=R REGION
```

where

jjjjjjjj Is the jobname of the waiting job.

PWSLCQ01 WARNING* I/O QUEUE FOR LOGICAL CHANNEL *yyyy* IS *xxx*

where

xxx Is the average queue depth.

yyyy Is the physical channels on this logical channel queue.

MTP

The Mounts Pending (MTP) sampler monitors tape and DASD-mount requests, and notifies the operator when outstanding mount requests have been pending for more than a specified interval.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>pending</i>	Is the number of minutes that a mount must remain pending for a warning message to be issued.

Example

Assuming a report interval of 30 seconds, this control statement

```
mtp 4,10
```

displays warning messages at two-minute intervals for each device with a mount pending for over 10 minutes.

Warning Message

The following warning message is issued by the MTP sampler:

```
PWSMTP01 WARNING* MOUNT FOR dvn (vvvvvv) OUTSTANDING FOR xx MINUTES
```

Message PWSMTP01 indicates that the mount request for device *dvn* has been outstanding for a period of time that exceeds the warning threshold.

Note: A blank volume serial number (*vvvvvv*) appears when volume rollover occurs.

NRQ

The Non Reusable Queue (NRQ) sampler displays a warning message when *both* of the following conditions occur:

- The number of available address space vector table slots (ASIDs) reserved for replacing address space IDs marked as non-reusable drops below the specified threshold value (*limit1*).
- The number of slots available for starting new address spaces drops below the specified threshold value (*limit2*).

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default interval is 30 seconds.
<i>limit1</i>	Is the threshold for slots reserved for replacing slots marked non-reusable. The number of slots on the non-reusable replacement queue (value in ASVTANR) must be less than or equal to the specified number for a warning message to be issued.
<i>limit2</i>	Is the threshold for the available queue (number of additional address spaces that can be started). The number of slots on the available queue (ASVTAAV) must be less than or equal to the specified number for a warning message to be issued.

Note: Slots (ASIDs) are marked non-reusable when the job terminates while in a cross-memory environment. They remain unusable until all address spaces that had binds with the address space have ended.

The SYSPROG ASVT service displays the current and original values for the non-reusable replacement queue and the available queue.

Example

To display a warning message for a specified threshold, type

```
NRQ 2,5,10
```

This NRQ sampler checks every two intervals to see if there are less than six (limit1 value) slots remaining on the non-reusable replacement queue and less than 11 (limit2 value) slots on the available queue. A warning message is issued if both limit1 and limit2 have been reached. The message is reissued every minute (two intervals), assuming that the default interval value is 30 seconds, unless the number of slots on the available queue exceeds the limit2 value.

Warning Message

The following warning message is issued by the NRQ service:

```
PWSNRQ01 *WARNING* non-reusable replacement queue length is 4
```

NRQP

The Non Reusable Queue Percentage (NRQP) sampler displays a warning message when *both* of the following conditions occur:

- The percentage of available address space vector table slots (ASIDs) reserved for replacing address space IDs marked as non-reusable drops below the specified threshold value (limit1)
- The percentage of slots available for starting new address spaces drops below the specified threshold value (limit2).

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default interval is 30 seconds.
<i>limit1</i>	Is the threshold for slots reserved for replacing slots marked non-reusable. The percentage of slots on the non-reusable replacement queue ($ASVTANR / ASVTNONR * 100$) must be less than or equal to the specified percentage for a warning message to be issued.
<i>limit2</i>	Is the threshold for the percentage of address spaces (MAXUSER) that can still be started. The percentage of the original number of slots on the available queue that are still available ($ASVTAAV / ASVTMAXI * 100$) must be less than or equal to the specified percentage for a warning message to be issued.

Note: Slots (ASIDs) are marked non-reusable when the job terminates while in a cross-memory environment. They remain unusable until all address spaces that had binds with the address space have ended.

The SYSPROG AVST service displays the current and original values for the non-reusable replacement queue and the available queue.

Example

To display a warning message for a specified percentage, type

```
NRQP 10,25,10
```

Every 10 intervals, this NRQP sampler checks to see if less than 26% (limit1 value) of the slots remain on the non-reusable replacement queue. It also checks to see if less than 10% (limit2 value) of MAXUSER (obtained from ASVTMAXI) slots remain on the available queue.

A warning message is issued if both limit1 and limit2 have been reached. The message is reissued every minute (two intervals), assuming that the default interval value is 30 seconds, unless the percentage of slots on the available queue exceeds the limit2 value.

Warning Message

The following warning message is issued by the NRQP service:

```
PWSNRQP1 *WARNING* Non-reusable replacement queue length is 8% (2)
```

OUT

The Jobs Swapped Out (OUT) sampler monitors jobs swapped out of memory for an interval that exceeds the user-specified threshold. It also notifies the operator if any job, TSO user, or started task has been swapped out for an interval that exceeds the threshold. TSO users in input or output terminal wait are not considered.

Syntax

where

intervals Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).

time Is the threshold for swap-out in minutes.

Example

Assuming a report interval of 30 seconds, this control statement

```
out 2,1
```

displays warning messages at one-minute intervals for jobs, TSO users, or started tasks swapped out longer than one minute.

Warning Message

The following warning message is issued by the OUT sampler:

```
PSWOUT01 WARNING* JOB or TSU or STC jjjjjjjj SWAPPED OUT FOR xxx MINUTES
```

where

jjjjjjjj Is the jobname, TSO user, or started task.

xxx Is the number of minutes swapped out.

PAG

The Paging Rate (PAG) sampler monitors the system paging rate and notifies the operator when the number of paging operations-per-second exceeds a specified value.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>rate</i>	Is the paging rate per second measured over one reporting interval that triggers a warning message.

Example

Assuming a report interval of 30 seconds, this control statement

```
pag 4, 30
```

displays warning messages at two-minute intervals if the system paging rate exceeds 30 pages-per-second over the preceding two minutes.

Warning Message

The following warning message is issued by the PAG sampler:

```
PWSPAG01 WARNING* PAGING RATE IS xxx PER SECOND
```

Message PWSPAG01 indicates that the paging rate has exceeded the warning threshold.

PCPU

The PCPU sampler monitors CPU utilization for the host partition relative to its relative-share value and issues a warning message when utilization is outside of the limits that you specified. The limit values are specified as a percentage of the partition’s relative-share. Plex overhead is excluded when computing the partition’s CPU utilization.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default is 30 seconds (one interval).
<i>lowpct</i>	Is the low threshold percent. A warning message is issued if the partition receives less than this percentage of its relative-share of CPU over the sample period and the total Plex CPU utilization is at or above <i>plexpct</i> .. A value of zero indicates that no lower limit checking is to be performed. A value of 50 is assumed if both <i>lowpct</i> and <i>highpct</i> are omitted.
<i>highpct</i>	Is the high threshold percent. A warning message is issued if the partition receives more than this percentage of its relative-share of CPU over the sample period and the total Plex CPU utilization is at or above <i>plexpct</i> .. A value of zero indicates that no upper limit checking is to be performed.
<i>plexpct</i>	Is the Plex minimum percent. Warning messages for the <i>lowpct</i> and <i>highpct</i> conditions are suppressed when the total Plex CPU utilization is less than the specified percentage. The default percentage is 80%. Total Plex busy includes Plex dispatching overhead.

Example 1

```
PCPU, 2, 80, 200, 90
```

The reporting period is two intervals (one minute if the default interval is used). A warning message will be issued if the Plex is at least 90% utilized during the period and the host partition receives either less than 80% or more than 200% of its relative-share.

Example 2

```
PCPU, 1, 75
```

The reporting period is one interval (30 seconds if the default interval is used). A warning message will be issued if the Plex is at least 80% utilized (the default value) during the period *and* the host partition receives either less than 75% of its relative-share. No upper limit checking is performed.

Warning Messages

The following warning messages are issued by the PCPU sampler:

```
PWSPCPU1 *WARNING* Partition xxxxxxxx received nn.nn% of its Relative Share
```

Message PWSPCPU1 is issued when the partition receives less than the *lowpct* value during the period.

```
PWSPCPU2 *WARNING* Partition xxxxxxxx received nn.nn% of its Relative Share
```

Message PWSPCPU2 is issued when the partition receives more than the *highpct* value during the period.

PGQ

The Page Data Set I/O Queue (PGQ) sampler monitors the depth of I/Os queued to page data sets and notifies the operator if the average I/O queue depth to any page data set exceeds a specified threshold.

Note: Average queue depth computation includes samples taken when queue depth is zero; therefore, it can be less than one.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>depth</i>	Is the threshold average of I/Os queued to any page or swap data set.

Example

Assuming a report interval of 30 seconds, this control statement

```
pgq 4,5
```

displays warning messages at two-minute intervals if the average count of I/Os queued to any page-data set exceeds five.

Warning Message

The following warning message is issued by the PGQ sampler:

PWSPGQ01 WARNING* I/O QUEUE DEPTH FOR PAGE DATA SET *n* ON *vvvvvv* IS *xx*

where

<i>n</i>	Is the data set number.
<i>vvvvvv</i>	Is the volume serial of device.
<i>xx</i>	Is the I/O queue depth.

PGSR

The Performance Group Service (PGSR) sampler sends a warning message to the operator when an address space in a performance group uses an SRM component during a reporting interval at a rate that exceeds the specified threshold. You can suppress the message if a given total system service rate threshold is not reached during a reporting period.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>performance group</i>	Is the performance group number.
<i>rate</i>	Is the SRM component service rate for a performance group that must be reached before exception messages are issued.
<i>measure</i>	Specifies the SRM service measure to be monitored: C CPU service units I I/O service units M MSO service units T total service units; the default
<i>rptno</i>	Is the maximum number of address spaces that are listed whenever the specified rate is exceeded. The default is 5.

Example

Assuming a report interval of 30 seconds, this control statement

```
pgsr 8,2,100,t,5
```

displays up to five warning messages at four-minute intervals when any one address space in the performance group field uses more than a total of 100 SRM service units during a given reporting interval.

Warning Message

The following warning message is issued by the PGSR sampler:

```
PWSPGSR1 WARNING* mmm SERVICE RATE FOR ttt jjjjjjjj (PG ggg) is ppppp SU/SEC
```

Message PWSPGSR1 indicates that the performance group service-unit rate has exceeded the warning threshold, where

<i>mmm</i>	Is the SRM service component being monitored.
<i>ttt</i>	Is STC, TSU, or JOB.
<i>jjjjjjjj</i>	Is the address space name.
<i>ggg</i>	Is the performance group number.
<i>ppppp</i>	Is the number of service units.

PSRV

The Performance Group Service Rate Percentage (PSRV) sampler sends a warning message to the operator when an address space in a performance group uses more than the specified percentage of an SRM service component during a reporting interval. You can suppress the message if the total system service-rate threshold is not reached during a reporting period.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>performance group</i>	Is the performance group number.
<i>percent</i>	Is the percentage of total system SRM-component use that must be reached before exception messages are issued.
<i>measure</i>	Specifies the SRM service measure to be monitored: C CPU service units I I/O service units M MSO service units T total service units; the default
<i>rate</i>	Is the system SRM component use rate that must be reached before exception messages are issued. The default is a rate of 0.

Example

Assuming a report interval of 30 seconds, this control statement

```
psrv 6,2,50,t,150
```

displays warning messages at three-minute intervals when any one address space in the performance group field uses more than 50 percent of the total SRM user rate, if the total system rate is greater than 150 SU/SEC.

Warning Messages

The following warning messages are issued by the PSRV sampler:

```
PWSPSRV0 WARNING* PERFORMANCE GROUP ggg mmm SERVICE RATE IS sssss SU/SEC
```

Message PWSPSRV0 indicates that the performance group service-unit rate has exceeded the warning threshold, where

<i>ggg</i>	Is the performance group number.
<i>mmm</i>	Is the SRM service component being monitored.
<i>sssss</i>	Is the number of service units.

```
PWSPSRV1 WARNING* mmm SERVICE RATE FOR ttt jjjj IS pp% OF PG ggg mmm SERVICE USE
```

Message PWSPSRV1 indicates that the specified performance group service unit has exceeded the warning threshold, where

<i>mmm</i>	Is the SRM service component being monitored.
<i>ttt</i>	Is STC, TSU, or JOB.
<i>jjjj</i>	Is the address space name.
<i>ggg</i>	Is the performance group number.
<i>pp</i>	Is the percentage of the performance group <i>ggg</i> 's use of service component <i>mmm</i> by task <i>ttt</i> .

REP

The Replies Outstanding (REP) sampler monitors messages to the operator that require replies. This sampler notifies the operator when replies are outstanding over a user-specified interval. This sampler also lists the outstanding replies.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals and the time between consecutive samples for outstanding replies. The default is 30 seconds (one interval).
<i>time</i>	Is the minimum amount of time, in minutes, that a reply must be outstanding before it is reported. The actual time elapsed before an outstanding reply is reported might often be less than the value entered because a reply outstanding during a sampling interval is assumed outstanding for the entire interval.

Example

Assuming a report interval of 30 seconds, this control statement

```
rep 2,5
```

displays warning messages at one-minute intervals if a reply has been outstanding for more than five minutes.

Warning Message

The following warning message is issued by the REP sampler:

PWSREP01 WARNING* REPLIES OUTSTANDING FOR OVER *xx* MINUTES

Message PWSREP01 indicates that replies were outstanding for *xx* minutes.

RES

The DASD Reserves (RES) sampler monitors the reserved status of devices in a shared DASD system and notifies the operator when devices are reserved for more than a specified interval.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>time</i>	Is the number of minutes that a device must be reserved for a warning message to be issued.

Example

Assuming a report interval of 30 seconds, this control statement

```
res 10,10
```

displays warning messages at five-minute intervals if any device has been reserved for over 10 minutes.

Warning Messages

The following warning messages are issued by the RES sampler:

PWSRES01 WARNING* DEVICE *dvn* (*vvvvvv*) RESERVED FOR *yyy* MIN

Message PWSRES01 indicates that the device on *dvn* with volume serial number *vvvvvv* has been reserved for a period of time (*yyy*) that exceeds the warning threshold.

PWSRES01 WARNING* DEVICE *cuu* (*vvvvvv*) RESERVED FOR *yyy* MIN

Message PWSRES01 indicates that the device on *cuu* with volume serial number *vvvvvv* has been reserved for a period of time (*yyy*) that exceeds the warning threshold.

RSU

The Real Storage Usage (RSU) sampler monitors the status of real storage within the system and notifies the operator of address spaces that consume excessive amounts of real storage when the low SYSEVENT has been issued.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>rptno</i>	Is the maximum number of address spaces to be listed whenever low SYSEVENT has been issued. The default is 5.

Example

Assuming a report interval of 30 seconds, this control statement

```
rsu 2,7
```

displays warning messages at one-minute intervals whenever the low SYSEVENT has been issued for the address spaces of the top seven real storage users.

Warning Message

The following warning message is issued by the RSU sampler:

```
PWSRSU01 WARNING* REAL STORAGE USE FOR ttt jjjjjjjj IS sssss FRAMES
```

Message PWSRSU01 indicates that the low SYSEVENT has been issued, where

<i>ttt</i>	Is STC, TSU, or JOB.
<i>jjjjjjjj</i>	Is the address space name.
<i>sssss</i>	Is the number of real-storage frames.

SMF

The Status of SMF Recording (SMF) sampler notifies the operator if an SMF data set is full or SMF recording is not active, which ensures that no SMF data is lost.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>threshold</i>	Is the percentage of space in all SMF data sets that has been filled.

Example

Assuming a report interval of 30 seconds, this control statement

```
smf 10
```

displays a warning message every five minutes if any SMF data set is full.

Warning Messages

The following warning messages are issued by the SMF sampler:

```
PWSSMF01 WARNING* SMF IS NOT RECORDING
```

Message PWSSMF01 indicates that SMF data is not being collected. Accounting information will be lost.

PWSSMF02 WARNING* SYS1.MAN *n* IS FULL; DUMP IT ASAP

Message PWSSMF02 indicates that the indicated SMF data set is full. The SMF data set should be dumped as soon as possible so that SMF can reuse it.

PWSSMF03 WARNING* BOTH SMF DATA SETS ARE FULL; *xxxx* RECORDS LOST

Message PWSSMF03 indicates that SMF is unable to write records because both data sets are full; *xxxx* represents the number of records that SMF could not write.

PWSSMF04 WARNING* SYS1.MAN *n* IS PARTIALLY FULL AND INACTIVE; DUMP IT ASAP.

Message PWSSMF04 indicates that the SMF data set is partially full and inactive, and should be dumped as soon as possible so SMF can reuse it.

PWSSMF09 WARNING* SMF DATA SETS ARE *xxx%* FULL

Message PWSSMF09 indicates that the SMF data sets have used over a threshold percentage amount of their allocated space. You should monitor the SMF data set usage and dump them when they are filled.

SPA

The DASD Free Space (SPA) sampler monitors free space on specified DASD volumes and notifies the operator if the free space on any specified DASD volume falls below a specified number of cylinders.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>cylinder</i>	Is the low threshold of free cylinders.
<i>volser</i>	Is the volume serial number; the maximum number of volsers you can specify on a single statement is seven. The volsers that you specify must exist at the time you invoke the sampler.
<i>dvn</i>	Is the number of the device to be monitored; the maximum number of devices you can specify on a single statement is 14.

Example

Assuming a report interval of 30 seconds, this control statement

```
spa 10,50,work01,work02,work03,380,381
```

displays warning messages at five-minute intervals if free space on WORK01, WORK02, or WORK03, or on any volume mounted on device address 380 or 381, falls below 50 cylinders.

Warning Message

The following warning message is issued by the SPA sampler:

PWSSPA01 WARNING* *dvn vvvvvv* FREE CYLINDER/TRACK COUNT IS *xxx/yyyy*

where

<i>dvn</i>	Is the device address.
<i>vvvvvv</i>	Is the volume serial of device.
<i>xxx</i>	Is the count of free cylinders.
<i>yyyy</i>	Is the count of free tracks (not including cylinders).

SPLW

The SPLW sampler issues a warning message for address spaces that are waiting for SPOOL space.

Syntax

where

<i>intervals</i>	Specifies the length of the report period in intervals. The default report period is 30 seconds (one interval).
<i>max</i>	Is the maximum number of address spaces that will be reported during one report period. The default is 20; the maximum permitted value is 99.

Example

SPLW 4,15

The reporting period is four intervals (two minutes if the default interval is used). A warning message will be issued for each of the first 15 address spaces that are waiting for SPOOL space at the end of the report period.

SRM

The SRM sampler monitors the number of address spaces in use as a percentage of the MAXUSER setting in SYS1.PARMLIB member IEASYS00. This sampler also monitors the system Unreferenced Interval Count (UIC) based on user-specified low and high thresholds.

Syntax

where

<i>intervals</i>	Specifies the length in intervals of the sample period. The default sample period is 30 seconds (1 interval).
MAXUSER= <i>nn</i>	Is a percentage of the MAXUSER setting in SYS1.PARMLIB.
LOWUIC= <i>nn</i>	Is the low UIC threshold.
HIGHUIC= <i>nn</i>	Is the high UIC threshold.

Note: If you omit a threshold specification or specify zero, no threshold monitoring is performed.

Example

Assuming a report interval of 30 seconds, this control statement

```
srm 1,maxuser=80,lowuic=10,highuic=255
```

displays warning messages at 30-second intervals if the number of users exceeds 80 percent of the MAXUSER setting in SYS1.PARMLIB member IEASYS00, or the system Unreferenced Interval Count drops below 10 or exceeds 255.

SWP

The Swap Rate (SWP) sampler monitors system swap-out rate and notifies the operator when the number of address spaces swapped out per minute exceeds a specified value.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>rate</i>	Is the swap rate per minute measured over one reporting interval that triggers a warning message.

Example

Assuming a report interval of 30 seconds, this control statement

```
swp 4,30
```

displays warning messages at two-minute intervals if the swap-out rate exceeds 30 swaps-per-minute over the preceding two minutes.

Warning Message

The following warning message is issued by the SWP sampler:

```
PWSSWP01 WARNING* SWAP OUT RATE IS xxx PER MINUTE
```

Message PWSSWP01 indicates that the swap rate has exceeded the warning threshold.

Syntax

displays up to five warning messages at two-minute intervals for each interval in which the total time the CPU is busy increases 50 percent over the preceding interval. A warning is issued for any TSO address space that has been active 35 percent of the total CPU busy time.

Warning Message

The following warning message is issued by the TCPU sampler:

```
PWSTCPU1 WARNING* CPU USAGE IS ppp% FOR TSU jjjjjjjj
```

Message PWSTCPU1 indicates that the specified address space has exceeded the warning threshold for percentage of system CPU busy time, where

ppp Is the address space busy percentage.

jjjjjjjj Is the address space name.

TIO

The TSO I/O (TIO) sampler generates a warning message whenever a specified TSO address space is detected using more than a specified percentage of the total system I/O activity in a reporting interval. The message can be suppressed if a threshold for the total system I/O rate is not reached during a reporting interval. This sampler also notifies the operator when the I/O for a particular TSO address space exceeds the threshold.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>percent</i>	Is the percentage of total system I/O for which a TSO address space must be responsible before an exception message is issued for that address space.
<i>rptno</i>	Is the maximum number of TSO address spaces to be listed whenever a TSO I/O overload condition is detected. The default is 5.
<i>i/o rate</i>	Is the rate of EXCPs per second that must be reached before exception messages are issued. The default is a system I/O rate greater than 25 EXCPs-per-second.

Example

Assuming a report interval of 30 seconds, this control statement

```
tio 4,25,5,50
```

displays up to five warning messages at two-minute intervals if the system I/O rate exceeds 50 EXCPs-per-second over the preceding two minutes. A warning is issued for any TSO address space doing more than 25 percent of the I/O.

Warning Messages

The following warning messages are issued by the TIO sampler:

```
PWSTIO00 WARNING* TOTAL SYSTEM I/O RATE IS xxx EXCPS/SEC
```

Message PWSTIO00 indicates that the system I/O rate has exceeded the warning threshold.

```
PWSTIO01 WARNING* I/O RATE FOR TSU nnnnnnnn IS xxx% OF SYSTEM TOTAL
```

Message PWSTIO01 indicates that the specified address space has exceeded the warning threshold for percentage of system I/O, where

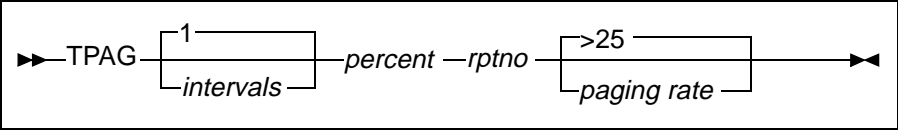

nnnnnnnn Is the address space name.

xxx Is the percent of the total system I/O rate.

TPAG

The TSO Paging (TPAG) sampler sends a warning message to the operator when a specified TSO address space is detected using more than a specified percentage of the total system paging activity during a reporting interval. The message can be suppressed if a given threshold for the total system paging rate is not reached during a reporting interval. This sampler also notifies the operator when the paging for a particular TSO address space exceeds the threshold.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>percent</i>	Is the percentage of total system paging for which a TSO address space must be responsible before an exception message is issued for that address space.
<i>rptno</i>	Is the maximum number of TSO address spaces to be listed whenever a TSO-paging overload condition is detected.
<i>paging rate</i>	Is the paging rate per second that must be reached before exception messages are issued. The default is a system paging rate greater than 25 EXCPs-per-second.

Example

Assuming a report interval of 30 seconds, this control statement

```
tpag 4,25,5,50
```

displays up to five warning messages at two-minute intervals if the system-paging rate exceeds 50 pages-per-second over the preceding two minutes. A warning is issued for any TSO address space doing more than 25 percent of the paging.

Warning Messages

The following warning messages are issued by the TPAG sampler:

```
PWSTPAG0 WARNING* TOTAL SYSTEM PAGING RATE IS NOW ppp PAGES/SEC
```

Message PWSTPAG0 indicates that the system-paging rate has exceeded the warning threshold.

```
PWSTPAG1 WARNING* PAGING RATE FOR JOB nnnnnnnn IS xxx% OF TOTAL SYSTEM PAGING
```

Message PWSTPAG1 indicates that the specified address space has exceeded the warning threshold for percentage of system paging, where

<i>nnnnnnnn</i>	Is the address space name.
-----------------	----------------------------

<i>xxx</i>	Is the percent of the total system paging rate.
------------	---

TSRV

The TSO Service (TSRV) sampler sends a warning message to the operator when a TSO address space uses more than the specified percentage of one or more SRM service measures during a reporting interval. The message can be suppressed if a given total system paging rate threshold is not reached during a reporting interval.

Syntax

where

intervals	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
percent	Is the percentage of total system SRM-component usage that TSO must be responsible for before an exception message is issued.
measure	Specifies the SRM service measure to be monitored: <div>C CPU service units I I/O service units M MSO service units T total service units; the default</div>
rptno	Is the maximum number of address spaces to be listed whenever a TSO-service overload condition is detected. The default is 5.
service rate	Is the system SRM service-consumption rate that must be reached before exception messages are issued. The default is a system service rate greater than zero SUs-per-second.

Example

Assuming a report interval of 30 seconds, this control statement

```
tsrv 4,35,t,5,50
```

displays up to five warning messages at two-minute intervals whenever an address space being monitored utilizes more than 35 percent of the total SRM components service during a reporting interval. This message can be suppressed if the system service rate threshold of 50 SUs-per-second is not reached during a reporting interval.

Warning Messages

The following warning messages are issued by the TSRV sampler:

```
PWSTSRV0 WARNING* ADDR SPACE mmm SERVICE RATE IS sssss SU/SEC
```

Message PWSTSRV0 indicates that the system paging rate has exceeded the warning threshold, where

<i>mmm</i>	Is the SRM service component being monitored.
<i>sssss</i>	Is the number of service units-per-second.

```
PWSTSRV1 WARNING* mmm SERVICE RATE FOR TSU jjjjjjjj IS ppp% OF SYSTEM TOTAL
```

Message PWSTSRV1 indicates that the specified address space has exceeded the warning threshold for percentage of system SRM component utilization, where

<i>mmm</i>	Is the SRM service component being monitored.
<i>jjjjjjjj</i>	Is the address space name.
<i>ppp</i>	Is the address space SRM component use as a percentage of system total.

WDLY

This SYSPROG Exception Monitor sampler can *only* be used from the MAINVIEW for OS/390 product.

The Workload Delay sampler warns you when a workload's delay meets or exceeds a specified threshold. A *delay* is the amount of time that a workload tried to use one or more resources and could not.

Syntax

where

<i>intervals</i>	Is the number of intervals between report periods; the default is 30 seconds (one interval).
<i>workload name</i>	Is the name of the workload to be monitored.
<i>workload name*</i>	Indicates a partial workload name. You can specify partial names using a wildcard character (an asterisk).
<i>percentage</i>	Represents the minimum percentage of delay. Any delay greater than this number generates a warning message. Delays are calculated for the current data collection interval as defined by MAINVIEW for OS/390. That is, if a data collection interval is defined as 15 minutes, the workload delay percentage is calculated for the current 15-minute period, regardless of how many minutes have elapsed.

Example

Assuming a report interval of 30 seconds, this control statement

```
wdly 6,mac*,30
```

displays warning messages every three minutes if any workload starting with the letters MAC is delayed more than 30 percent of the current MAINVIEW for OS/390 data collection interval.

Warning Message

The following warning message is issued by the WDLY sampler:

```
PWSWDLY0 *WARNING* Workload wwwwww Delayed xxx.xx%
```

Message PWSWDLY0 indicates that workload *wwwwww* has been delayed *xxx.xx* percent of the current MAINVIEW for OS/390 data collection interval.

Warning Message

The following warning message is issued by the WOBJ sampler:

```
PWSWOBJ0 *WARNING* Workload wwwwww at xxx% of its objective
```

Message PWSWOBJ0 indicates that workload *wwwwww* has met *xxx* percent of its objective.

WRT

This SYSPROG Exception Monitor sampler can *only* be used from the MAINVIEW for OS/390 product.

The Workload Response Time (WRT) sampler warns you when the response time for workloads that match your specified selection criteria reaches or exceeds the threshold you specified.

Syntax

where

<i>intervals</i>	Is the length of the report period in intervals; the default is 30 seconds (one interval).
<i>workload name</i>	Is the name of the workload to be monitored.
<i>workload name*</i>	Indicates a partial workload name. You can specify partial names using a wildcard character (an asterisk), which indicates that only the characters prior to the asterisk are to be used for comparison.
<i>period</i>	Represents the performance period for the workload, which is to be used when checking the response time against the threshold value.
<i>seconds</i>	Is the response-time threshold expressed in hundredths of a second.

Example

Assuming a report interval of 30 seconds, this example

```

wrt 2,tso*,1,70
wrt 2,tso*,2,200
wrt 2,tso*,3,300
wrt 2,tso*,4,400
  
```

illustrates the use of four separate sampler definitions. Each definition defines a response-time threshold for a specific performance period. A partial name

of *tso** is specified for each, indicating that any workload name that begins with *tso* is to be considered.

- The first definition indicates that a warning message should be issued if the response time for performance period 1 is 0.7 seconds or greater.
- The threshold for performance group 2 is two seconds.
- The threshold for performance group 3 is three seconds.
- The threshold for performance group 4 is four seconds.

Warning Message

The following warning message is issued by the WRT sampler:

```
PWSWRT00 *WARNING* Workload wwwwww response time is xxx.xx seconds
```

Message PWSWRT00 indicates that the overall response time for workload *wwwwww* is *xxx.xx* seconds.

WTO

The WTO Buffer Usage (WTO) sampler monitors usage of console buffers and anticipates problems caused by a backlog of messages to be displayed on a system console.

Syntax

where

intervals Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).

threshold Is the percentage of console buffers in use that causes a warning message to be issued. The default threshold is 75 percent.

Example

Assuming a report interval of 30 seconds, this control statement

```
wto 1,80
```

displays a warning message every 30 seconds when the use of console buffers exceeds 80 percent.

Warning Message

The following warning message is issued by the WTO sampler:

```
PWSWTO01 WARNING* CONSOLE BUFFER USAGE IS xxx%
```

Message PWSWTO01 indicates that the specified threshold has been exceeded. You should check the status of the consoles.

WTOR

The WTOR sampler monitors usage of console reply buffers and displays a warning message when the user-specified threshold is reached.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default sample period is 30 seconds (one interval).
<i>threshold</i>	Is the percentage of console buffers in use that causes a warning message to be issued. The default threshold is 75 percent.

Example

Assuming a report interval of 30 seconds, this control statement

```
wtor 1,80
```

displays a warning message every 30 seconds when the use of console buffers exceeds 80 percent.

Warning Message

The following warning message is issued by the WTOR sampler:

```
PWSWTOR1 *WARNING* WTOR BUFFER USAGE IS xxx%
```

Message PWSWTOR1 indicates that the specified threshold has been exceeded. You should check the status of the consoles.

XCPU

The XCPU sampler monitors CPU utilization for the entire Plex and issues a warning message when the total CPU utilization is outside of the limits that you specified. Plex overhead is included in total CPU utilization.

Syntax

where

<i>intervals</i>	Specifies the length of the sample period in intervals. The default is 30 seconds (one interval).
<i>lowpct</i>	Is the low threshold percent. A warning message is issued if the total Plex CPU utilization during the period is less than the specified percentage. Plex dispatch overhead is included in CPU utilization.
<i>highpct</i>	Is the high threshold percent. A warning message is issued if the total Plex CPU utilization during the period exceeds the specified percentage. Plex dispatch overhead is included in CPU utilization.

Example 1

```
XCPU , 2 , 40
```

The reporting period is two intervals (one minute if the default interval is used). A warning message will be issued if the Plex is less than 40% utilized during the period.

Example 2

```
XCPU,10,0.90
```

The reporting period is 10 intervals (five minutes if the default interval is used). A warning message will be issued if the Plex is less than 90% utilized during the period.

Example 3

```
XCPU,10,40,90
```

The reporting period is 10 intervals (five minutes if the default interval is used). A warning message will be issued if the Plex is less than 40% or more than 90% utilized during the period.

Warning Messages

The following warning messages are issued by the XCPU sampler:

```
PWSXCPU1 *WARNING* Total PLEX Utilization is nn.nn%
```

Message PWSXCPU1 is issued when the total Plex utilization is less than the *lowpct* value during the period.

```
PWSXCPU2 *WARNING* Total PLEX Utilization is nn.nn%
```

Message PWSXCPU2 is issued when the total Plex utilization is more than the *highpct* value during the period.

Glossary

This glossary defines BMC Software terminology. Other dictionaries and glossaries can be used in conjunction with this glossary.

Since this glossary pertains to BMC Software-related products, some of the terms defined might not appear in this book.

To help you find the information you need, this glossary uses the following cross-references:

Contrast with indicates a term that has a contrary or contradictory meaning.

See indicates an entry that is a synonym or contains expanded information.

See also indicates an entry that contains related information.

action	Defined operation, such as modifying a MAINVIEW window, that is performed in response to a command. <i>See</i> object.
active window	Any MAINVIEW window in which data can be refreshed. <i>See</i> alternate window, current window, window.
administrative view	Display from which a product's management tasks are performed, such as the DSLIST view for managing historical data sets. <i>See</i> view.
ALT WIN field	Input field that allows you to specify the window identifier for an alternate window where the results of a hyperlink are displayed. <i>See</i> alternate window.
Alternate Access	<i>See</i> MAINVIEW Alternate Access.
alternate form	View requested through the FORM command that changes the format of a previously displayed view to show related information. <i>See also</i> form, query.

alternate window	(1) Window that is specifically selected to display the results of a hyperlink. (2) Window whose identifier is defined to the ALT WIN field. <i>Contrast with</i> current window. <i>See</i> active window, window, ALT WIN field.
analyzer	(1) Online display that presents a snapshot of status and activity data and indicates problem areas. (2) Component of CMF MONITOR. <i>See</i> CMF MONITOR Analyzer.
application	(1) Program that performs a specific set of tasks within a MAINVIEW product. (2) In MAINVIEW VistaPoint, combination of workloads to enable display of their transaction performance data in a single view.
application trace	<i>See</i> trace.
ASCH workload	Workload comprising Advanced Program-to-Program Communication (APPC) address spaces.
AutoCustomization	Online facility for customizing the installation of products. AutoCustomization provides an ISPF panel interface that both presents customization steps in sequence and provides current status information about the progress of the installation.
automatic screen update	Usage mode wherein the currently displayed screen is refreshed automatically with new data at an interval you specify. Invoked by the ASU command.
batch workload	Workload consisting of address spaces running batch jobs.
BBI	Basic architecture that distributes work between workstations and multiple OS/390 targets for BMC Software MAINVIEW products.
BBI-SS PAS	<i>See</i> BBI subsystem product address space.
BBI subsystem product address space (BBI-SS PAS)	OS/390 subsystem address space that manages communication between local and remote systems and that contains one or more of the following products: <ul style="list-style-type: none"> • MAINVIEW AutoOPERATOR • MAINVIEW for CICS • MAINVIEW for DB2 • MAINVIEW for DBCTL • MAINVIEW for IMS Online • MAINVIEW for MQSeries (formerly Command MQ for S/390) • MAINVIEW SRM • MAINVIEW VistaPoint (for CICS, DB2, DBCTL, and IMS workloads)
BBPARM	<i>See</i> parameter library.

BBPROC	<i>See</i> procedure library.
BBPROF	<i>See</i> profile library.
BBSAMP	<i>See</i> sample library.
BBV	<i>See</i> MAINVIEW Alternate Access.
BBXS	BMC Software Subsystem Services. Common set of service routines loaded into common storage and used by several BMC Software MAINVIEW products.
border	Visual indication of the boundaries of a window.
bottleneck analysis	Process of determining which resources have insufficient capacity to provide acceptable service levels and that therefore can cause performance problems.
CA-Disk	Data management system by Computer Associates that replaced the DMS product.
CAS	Coordinating address space. One of the address spaces used by the MAINVIEW windows environment architecture. The CAS supplies common services and enables communication between linked systems. Each OS/390 or z/OS image requires a separate CAS. Cross-system communication is established through the CAS using VTAM and XCF communication links.
CFMON	<i>See</i> coupling facility monitoring.
chart	Display format for graphical data. <i>See also</i> graph.
CICSplex	User-defined set of one or more CICS systems that are controlled and managed as a single functional entity.
CMF MONITOR	Comprehensive Management Facility MONITOR. Product that measures and reports on all critical system resources, such as CPU, channel, and device usage; memory, paging, and swapping activity; and workload performance.
CMF MONITOR Analyzer	Batch component of CMF MONITOR that reads the SMF user and 70 series records created by the CMF MONITOR Extractor and/or the RMF Extractor and formats them into printed system performance reports.
CMF MONITOR Extractor	Component of CMF that collects performance statistics for CMF MONITOR Analyzer, CMF MONITOR Online, MAINVIEW for OS/390, and RMF postprocessor. <i>See</i> CMF MONITOR Analyzer, CMF MONITOR Online, MAINVIEW for OS/390.

CMF MONITOR Online

Component of CMF that uses the MAINVIEW window interface to present data on all address spaces, their use of various system resources, and the delays that each address space incurs while waiting for access to these resources. *See* CMF MONITOR, MAINVIEW for OS/390.

CMF Type 79 API

Application programming interface, provided by CMF, that provides access to MAINVIEW SMF-type 79 records.

CMFMON

Component of CMF MONITOR that simplifies online retrieval of information about system hardware and application performance and creates MAINVIEW SMF-type 79 records.

The CMFMON *online facility* can be used to view data in one or more formatted screens.

The CMFMON *write facility* can be used to write collected data as MAINVIEW SMF-type 79 records to an SMF or sequential data set.

CMRDETL

MAINVIEW for CICS data set that stores detail transaction records (type 6E) and abend records (type 6D). Detail records are logged for each successful transaction. Abend records are written when an abend occurs. Both records have the same format when stored on CMRDETL.

CMRSTATS

MAINVIEW for CICS data set that stores both CICS operational statistic records, at five-minute intervals, and other records, at intervals defined by parameters specified during customization (using CMRSOPT).

column

Vertical component of a view or display, typically containing fields of the same type of information, that varies by the objects associated in each row.

collection interval

Length of time data is collected. *See also* delta mode, total mode.

command delimiter

Special character, usually a ; (semicolon), used to stack commands typed concurrently on the COMMAND line for sequential execution.

COMMAND line

Line in the control area of the display screen where primary commands can be typed. *Contrast with* line command column.

Command MQ Automation D/S

Command MQ agents, which provide local proactive monitoring for both MQSeries and MSMQ (Microsoft message queue manager). The Command MQ agents operate at the local node level where they continue to perform functions regardless of the availability of the MQM (message queue manager) network. Functionality includes automatic monitoring and restarts of channels, queue managers, queues and command servers. In cases where automated recovery is not possible, the agents transport critical alert information to a central console.

Command MQ Automation S/390

Command MQ component, which monitors the MQM (message queue manager) networks and intercedes to perform corrective actions when problems arise. Solutions include:

- Dead-Letter Queue management
- System Queue Archival
- Service Interval Performance solutions
- Channel Availability

These solutions help ensure immediate relief to some of the most pressing MQM operations and performance problems.

Command MQ for D/S

Command MQ for D/S utilizes a true client/server architecture and employs resident agents to provide configuration, administration, performance monitoring and operations management for the MQM (message queue manager) network.

Command MQ for S/390

See MAINVIEW for MQSeries.

COMMON STORAGE MONITOR

Component of MAINVIEW for OS/390 that monitors usage and reconfigures OS/390 or z/OS common storage blocks.

composite workload

Workload made up of a WLM workload or other workloads, which are called *constituent workloads*.

constituent workload

Member of a composite workload. Constituent workloads in a composite usually belong to a single workload class, but sometimes are mixed.

contention

Occurs when there are more requests for service than there are servers available.

context

In a Plex Manager view, field that contains the name of a target or group of targets specified with the CONTEXT command. *See* scope, service point, SSI context, target context.

CONTEXT command

Specifies either a MAINVIEW product and a specific target for that product (*see* target context) or a MAINVIEW product and a name representing one or more targets (*see* SSI context) for that product.

control statement	(1) Statement that interrupts a sequence of instructions and transfers control to another part of the program. (2) Statement that names samplers and other parameters that configure the MAINVIEW components to perform specified functions. (3) In CMF MONITOR, statement in a parameter library member used to identify a sampler in the extractor or a report in the analyzer, or to describe either component's processing requirements to the operating system.
coupling facility monitoring (CFMON)	Coupling facility views that monitor the activity of your system's coupling facilities.
current data	Data that reflects the system in its current state. The two types of current data are real-time data and interval data. <i>Contrast with</i> historical data. <i>See also</i> interval data, real-time data.
current window	In the MAINVIEW window environment, window where the main dialog with the application takes place. The current window is used as the default window destination for commands issued on the COMMAND line when no window number is specified. <i>Contrast with</i> alternate window. <i>See</i> active window, window.
DASD	(Direct Access Storage Device) (1) A device with rotating recording surfaces that provides immediate access to stored data. (2) Any device that responds to a DASD program.
DASD ADVISOR	An interactive software tool that diagnoses DASD performance problems and makes recommendations to reduce overall service time. This tool measures and reports on the operational performance of IBM and IBM-compatible devices.
data collector	Program that belongs to a MAINVIEW product and that collects data from various sources and stores the data in records used by views. For example, MAINVIEW for OS/390 data collectors obtain data from OS/390 or z/OS services, OS/390 or z/OS control blocks, CMF MONITOR Extractor control blocks, and other sources. <i>Contrast with</i> extractor.
delta mode	(1) In MAINVIEW for DB2 analyzer displays, difference between the value sampled at the start of the current statistics interval and the value sampled by the current analyzer request. <i>See also</i> statistics interval. (2) In CMFMON, usage mode wherein certain columns of data reflect the difference in values between one sample cycle and the next. Invoked by the DELta ON command. <i>See also</i> collection interval, sample cycle, total mode.
DFSMS	(Data Facility Storage Management System) Data management, backup, and HSM software from IBM for OS/390 or z/OS mainframes.
DMR	<i>See</i> MAINVIEW for DB2.

DMS	(Data Management System) <i>See</i> CA-Disk.
DMS2HSM	<i>See</i> MAINVIEW SRM DMS2HSM.
DSO	(Data Set Optimizer) CMF MONITOR Extractor component that uses CMF MONITOR Extractor data to produce reports specifying the optimal ordering of data sets on moveable head devices.
EasyHSM	<i>See</i> MAINVIEW SRM EasyHSM.
EasyPOOL	<i>See</i> MAINVIEW SRM EasyPOOL.
EasySMS	<i>See</i> MAINVIEW SRM EasySMS.
element	(1) Data component of a data collector record, shown in a view as a field. (2) Internal value of a field in a view, used in product functions.
element help	Online help for a field in a view. The preferred term is <i>field help</i> .
Enterprise Storage Automation	<i>See</i> MAINVIEW SRM Enterprise Storage Automation.
event	A message issued by Enterprise Storage Automation. User-defined storage occurrences generate events in the form of messages. These events provide an early warning system for storage problems and are routed to user-specified destinations for central viewing and management.
Event Collector	Component for MAINVIEW for IMS Online, MAINVIEW for IMS Offline, and MAINVIEW for DBCTL that collects data about events in the IMS environment. This data is required for Workload Monitor and optional for Workload Analyzer (except for the workload trace service). This data also is recorded as transaction records (X'FA') and program records (X'F9') on the IMS system log for later use by the MAINVIEW for IMS Offline components: Performance Reporter and Transaction Accountant.
expand	Predefined link from one display to a related display. <i>See also</i> hyperlink.
extractor	Program that collects data from various sources and keeps the data control blocks to be written as records. Extractors obtain data from services, control blocks, and other sources. <i>Contrast with</i> data collector.
extractor interval	<i>See</i> collection interval.
fast path	Predefined link between one screen and another. To use the fast path, place the cursor on a single value in a field and press Enter . The resulting screen displays more detailed information about the selected value. <i>See also</i> hyperlink.

field	Group of character positions within a screen or report used to type or display specific information.
field help	Online help describing the purpose or contents of a field on a screen. To display field help, place the cursor anywhere in a field and press PF1 (HELP). In some products, field help is accessible from the screen help that is displayed when you press PF1 .
filter	Selection criteria used to limit the number of rows displayed in a view. Data that does not meet the selection criteria is not displayed. A filter is composed of an element, an operator, and an operand (a number or character string). Filters can be implemented in view customization, through the PARM/QPARM commands, or through the Where/QWhere commands. Filters are established against elements of data.
fire	The term used to indicate that an event has triggered an action. In MAINVIEW AutoOPERATOR, when a rule selection criteria matches an incoming event and <i>fires</i> , the user-specified automation actions are performed. This process is also called <i>handling</i> the event.
fixed field	Field that remains stationary at the left margin of a screen that is scrolled either right or left.
FOCAL POINT	MAINVIEW product that displays a summary of key performance indicators across systems, sites, and applications from a single terminal.
form	One of two constituent parts of a view; the other is query. A form defines how the data is presented; a query identifies the data required for the view. <i>See also</i> query, view.
full-screen mode	Display of a MAINVIEW product application or service on the entire screen. There is no window information line. <i>Contrast with</i> windows mode.
global command	Any MAINVIEW window interface command that can affect all windows in the window area of a MAINVIEW display.
graph	Graphical display of data that you select from a MAINVIEW window environment view. <i>See also</i> chart.
hilevel	For MAINVIEW products, high-level data set qualifier required by a site's naming conventions.
historical data	(1) Data that reflects the system as it existed at the end of a past recording interval or the duration of several intervals. (2) Any data stored in the historical database and retrieved using the TIME command. <i>Contrast with</i> current data, interval data and real-time data.

historical database	Collection of performance data written at the end of each installation-defined recording interval and containing up to 100 VSAM clusters. Data is extracted from the historical database with the TIME command. <i>See</i> historical data.
historical data set	In MAINVIEW products that display historical data, VSAM cluster file in which data is recorded at regular intervals.
HSM	(Hierarchical Storage Management) Automatic movement of files from hard disk to slower, less-expensive storage media. The typical hierarchy is from magnetic disk to optical disk to tape.
hyperlink	<p>(1) Preset field in a view or an EXPAND line on a display that permits you to</p> <ul style="list-style-type: none"> • access cursor-sensitive help • issue commands • link to another view or display <p>The transfer can be either within a single product or to a related display/view in a different BMC Software product. Generally, hyperlinked fields are highlighted. (2) Cursor-activated short path from a topic or term in online help to related information. <i>See also</i> fast path.</p>
Image log	<p>Collection of screen-display records. Image logs can be created for both the BBI-SS PAS and the BBI terminal session (TS).</p> <p>The BBI-SS PAS Image log consists of two data sets that are used alternately: as one fills up, the other is used. Logging to the BBI-SS PAS Image log stops when both data sets are filled and the first data set is not processed by the archive program.</p> <p>The TS Image log is a single data set that wraps around when full.</p>
IMSPlex System Manager (IPSM)	MVIMS Online and MVDBC service that provides Single System Image views of resources and bottlenecks for applications across one or more IMS regions and systems.
interval data	<p>Cumulative data collected during a collection interval. Intervals usually last from 15 to 30 minutes depending on how the recording interval is specified during product customization. <i>Contrast with</i> historical data.</p> <p>Note: If change is made to the workloads, a new interval will be started.</p> <p><i>See also</i> current data and real-time data.</p>
InTune	Product for improving application program performance. It monitors the program and provides information used to reduce bottlenecks and delays.

IRUF	IMS Resource Utilization File (IRUF). IRUFs can be either detail (one event, one record) or summarized (more than one event, one record). A detail IRUF is created by processing the IMS system log through a program called IMFLEEDIT. A summarized IRUF is created by processing one or more detail IRUFs, one or more summarized IRUFs, or a combination of both, through a sort program and the TASCOSTR program.
job activity view	Report about address space consumption of resources. <i>See</i> view.
journal	Special-purpose data set that stores the chronological records of operator and system actions.
Journal log	<p>Collection of messages. Journal logs are created for both the BBI-SS PAS and the BBI terminal session (TS).</p> <p>The BBI-SS PAS Journal log consists of two data sets that are used alternately: as one fills up, the other is used. Logging to the BBI-SS PAS Journal log stops when both data sets are filled and the first data set is not being processed by the archive program.</p> <p>The TS Journal log is a single data set that wraps around when full.</p>
line command	Command that you type in the line command column in a view or display. Line commands initiate actions that apply to the data displayed in that particular row.
line command column	Command input column on the left side of a view or display. <i>Contrast with</i> COMMAND line.
Log Edit	In the MAINVIEW for IMS Offline program named IMFLEEDIT, function that extracts transaction (X'FA') and program (X'F9') records from the IMS system log. IMFLEEDIT also extracts certain records that were recorded on the system log by IMS. IMFLEEDIT then formats the records into a file called the IMS Resource Utilization File (IRUF).
MAINVIEW	BMC Software integrated systems management architecture.
MAINVIEW Alarm Manager (MV ALARM)	In conjunction with other MAINVIEW products, notifies you when an exception occurs. MAINVIEW Alarm Manager is capable of monitoring multiple systems simultaneously, which means that MAINVIEW Alarm Manager installed on one system keeps track of your entire sysplex. You can then display a single view that shows exceptions for all MAINVIEW performance monitors within your OS/390 or z/OS enterprise.

MAINVIEW Alternate Access

Enables MAINVIEW products to be used without TSO by providing access through EXCP and VTAM interfaces.

MAINVIEW Application Program Interface (MVAPI)

A CLIST- or REXX-based, callable interface that allows MAINVIEW AutoOPERATOR EXECs to access MAINVIEW monitor product view data.

MAINVIEW AutoOPERATOR

Product that uses tools, techniques, and facilities to automate routine operator tasks and provide online performance monitoring, and that achieves high availability through error minimization, improved productivity, and problem prediction and prevention.

MAINVIEW control area

In the MAINVIEW window environment, first three lines at the top of the view containing the window information line and the COMMAND, SCROLL, CURR WIN, and ALT WIN lines. The control area cannot be customized and is part of the information display. *Contrast with* MAINVIEW display area, MAINVIEW window area.

MAINVIEW Desktop Version of the MAINVIEW window interface designed to run on OS/2 and Windows workstations.

MAINVIEW display area

See MAINVIEW window area.

MAINVIEW Explorer Product that provides access to MAINVIEW products from a Web browser running under Windows. MAINVIEW Explorer replaces MAINVIEW Desktop.

MAINVIEW for CICS Product (formerly MV MANAGER for CICS) that provides real-time application performance analysis and monitoring for CICS system management.

MAINVIEW for DB2 Product (formerly MV MANAGER for DB2) that provides real-time and historical application performance analysis and monitoring for DB2 subsystem management.

MAINVIEW for DBCTL (MVDBC)

Product that provides real-time application performance analysis and monitoring for DBCTL management.

MAINVIEW for IMS (MVIMS) Offline

Product with a Performance Reporter component that organizes data and prints reports used to analyze IMS performance and a Transaction Accountant component that produces cost accounting and user charge-back records and reports.

MAINVIEW for IMS (MVIMS) Online

Product that provides real-time application performance analysis and monitoring for IMS management.

MAINVIEW for IP

Product that monitors OS/390 and z/OS mission-critical application performance as it relates to TCP/IP stack usage. Collected data includes availability, connections, response times, routers, service levels, storage, traffic, Web cache, and so on.

MAINVIEW for Linux–Servers

Product that allows you to monitor the performance of your Linux systems from the MAINVIEW windows interface.

MAINVIEW for MQSeries (formerly known as Command MQ for S/390)

Delivers comprehensive capabilities for configuration, administration, performance monitoring and operations management for an entire MQM (message queue manager) network.

MAINVIEW for OS/390

System management application (formerly known as MAINVIEW for MVS prior to version 2.5). Built upon the MAINVIEW window environment architecture, it uses the window interface to provide access to system performance data and other functions necessary in the overall management of an enterprise.

MAINVIEW for UNIX System Services

System management application that allows you to monitor the performance of the Unix System Services from a MAINVIEW window interface.

MAINVIEW for VTAM

Product that displays application performance data by application, transaction ID, and LU name. This collected data includes connections, response time statistics, application availability, and application throughput.

MAINVIEW for WebSphere Application Server (formerly known as MAINVIEW for WebSphere)

Product that provides extensive monitoring for the IBM WebSphere Application Server for z/OS and OS/390 environment.

MAINVIEW Selection Menu

ISPF selection panel that provides access to all MAINVIEW windows-mode and full-screen mode products.

MAINVIEW SRM

See MAINVIEW Storage Resource Manager (SRM).

MAINVIEW SRM DMS2HSM

Product that facilitates the conversion of CA-Disk, formerly known as DMS, to HSM.

MAINVIEW SRM EasyHSM

Product that provides online monitoring and reporting to help storage managers use DFHSM efficiently.

MAINVIEW SRM EasyPOOL

Product that provides control over data set allocation and enforcement of allocation and naming standards. EasyPOOL functions operate at the operating system level to intercept normal job processing, thus providing services without any JCL changes.

MAINVIEW SRM EasySMS

Product that provides tools that aid in the conversion to DFSMS and provides enhancement to the DFSMS environment after implementation. EasySMS consists of the EasyACS functions, the SMSACSTE function, and the Monitoring and Positioning Facility.

MAINVIEW SRM Enterprise Storage Automation

Product that delivers powerful event generation and storage automation technology across the storage enterprise. Used in conjunction with MAINVIEW AutoOPERATOR, automated solutions to perform pool, volume, application, or data set-level manipulation can be created and used in response to any condition or invoked to perform ad hoc requests.

MAINVIEW SRM SG-Auto

Product that provides early warning notification of storage anomalies and automated responses to those anomalies based on conditions in the storage subsystem.

MAINVIEW SRM SG-Control

Product that provides real-time monitoring, budgeting, and control of DASD space utilization.

MAINVIEW SRM StopX37/II

Product that provides enhancements to OS/390 or z/OS space management, reducing the incidence of space-related processing problems. The StopX37/II functions operate at the system level to intercept abend conditions or standards violations, thus providing services without any JCL changes.

MAINVIEW SRM StorageGUARD

Product that monitors and reports on DASD consumption and provides historical views to help control current and future DASD usage.

MAINVIEW Storage Resource Manager (SRM)

Suite of products that assist in all phases of OS/390 or z/OS storage management. MAINVIEW SRM consists of products that perform automation, reporting, trend analysis, and error correction for storage management.

MAINVIEW SYSPROG Services

See SYSPROG services.

MAINVIEW VistaPoint

Product that provides enterprise-wide views of performance. Application and workload views are available for CICS, DB2, DBCTL, IMS, OS/390, or z/OS. Data is summarized at the level of detail needed; for example, views can be for a single target, an OS/390 or z/OS image, or an entire enterprise.

MAINVIEW window area

Portion of the information display that is not the control area and in which views are displayed and windows opened. It includes all but the first three lines of the information display. *Contrast with* MAINVIEW control area.

monitor

Online service that measures resources or workloads at user-defined intervals and issues warnings when user-defined thresholds are exceeded.

Multi-Level Automation (MLA)

The user-defined, multiple step process in Enterprise Storage Automation that implements solutions in a tiered approach, where solutions are invoked one after another until the condition is resolved.

MVALARM

See MAINVIEW Alarm Manager.

MVAPI

See MAINVIEW Application Program Interface.

MVCICS

See MAINVIEW for CICS.

MVDB2

See MAINVIEW for DB2.

MVDBC

See MAINVIEW for DBCTL.

MVIMS

See MAINVIEW for IMS.

MVIP

See MAINVIEW for IP.

MVLNX

See MAINVIEW for Linux–Servers.

MVMQ

See MAINVIEW for MQSeries.

MVMVS

See MAINVIEW for OS/390.

MVScope

MAINVIEW for OS/390 application that traces both CPU usage down to the CSECT level and I/O usage down to the channel program level.

MVSRM

See MAINVIEW Storage Resource Manager (SRM).

MVSRMHSM

See MAINVIEW SRM EasyHSM.

MVSRMSGC	<i>See</i> MAINVIEW SRM SG-Control.
MVSRMSGD	<i>See</i> MAINVIEW SRM StorageGUARD.
MVSRMSGP	<i>See</i> MAINVIEW SRM StorageGUARD.
MVUSS	<i>See</i> MAINVIEW for UNIX System Services.
MVVP	<i>See</i> MAINVIEW VistaPoint.
MVVTAM	<i>See</i> MAINVIEW for VTAM.
MVWEB	<i>See</i> MAINVIEW for WebSphere Application Server.
nested help	Multiple layers of help pop-up windows. Each successive layer is accessed by clicking a hyperlink from the previous layer.
object	<p>Anything you can manipulate as a single unit. MAINVIEW objects can be any of the following: product, secondary window, view, row, column, or field.</p> <p>You can issue an action against an object by issuing a line command in the line command column to the left of the object. <i>See</i> action.</p>
OMVS workload	Workload consisting of OS/390 OpenEdition address spaces.
online help	Help information that is accessible online.
OS/390 and z/OS Installer	BMC Software common installation system for mainframe products.
OS/390 product address space (PAS)	Address space containing OS/390 or z/OS data collectors, including the CMF MONITOR Extractor. Used by MAINVIEW for OS/390, MAINVIEW for UNIX System Services, and CMF MONITOR products. <i>See</i> PAS.
parameter library	<p>Data set consisting of members that contain parameters for specific MAINVIEW products or a support component. There can be several versions:</p> <ul style="list-style-type: none"> the distributed parameter library, called BBPARM a site-specific parameter library or libraries <p>These can be</p> <ul style="list-style-type: none"> a library created by AutoCustomization, called UBBPARM a library created manually, with a unique name

PAS	Product address space. Used by the MAINVIEW products. Contains data collectors and other product functions. <i>See also</i> OS/390 product address space (PAS) <i>and</i> BBI subsystem product address space (BBI-SS PAS).
performance group workload	Collection of address spaces defined to OS/390 or z/OS. If you are running OS/390 or z/OS with WLM in compatibility mode, MAINVIEW for OS/390 creates a performance group workload instead of a service class.
PERFORMANCE MANAGER	MAINVIEW for CICS online service for monitoring and managing current performance of CICS regions.
Performance Reporter (MVIMS)	MVIMS Offline component that organizes data and prints reports that can be used to analyze IMS performance.
Performance Reporter	Product component that generates offline batch reports. The following products can generate these reports: <ul style="list-style-type: none">• MAINVIEW for DB2• MAINVIEW for CICS
Plex Manager	Product through which cross-system communication, MAINVIEW security, and an SSI context are established and controlled. Plex Manager is shipped with MAINVIEW window environment products as part of the coordinating address space (CAS) and is accessible as a menu option from the MAINVIEW Selection Menu.
pop-up display	Full-screen panel that displays additional information about a selected event in a detail trace.
pop-up window	Window containing help information that, when active, overlays part of the window area. A pop-up window is displayed when you issue the HELP command while working in windows-mode.
PRGP workload	In MVS/SP 5.0 or earlier, or in compatibility mode in MVS/SP 5.1 or later, composite of service classes. MAINVIEW for OS/390 creates a performance group workload for each performance group defined in the current IEAIPS.xx member.

procedure library Data set consisting of members that contain executable procedures used by MAINVIEW AutoOPERATOR. These procedures are execute command lists (EXECs) that automate site functions. There can be several versions:

- the distributed parameter library, called BBPROC
- a site-specific parameter library or libraries

These can be

- a library created by AutoCustomization, called UBBPROC
- a library created manually, with a unique name

The site-created EXECs can be either user-written or customized MAINVIEW AutoOPERATOR-supplied EXECs from BBPROC.

product address space

See PAS.

profile library

Data set consisting of members that contain profile information and cycle refresh definitions for a terminal session connected to a BBI-SS PAS. Other members are dynamically created by MAINVIEW applications. There can be several versions:

- the distributed profile library, called BBPROF
- a site-specific profile library or libraries

These can be

- a library created by AutoCustomization, called SBBPROF
- a library created manually, with a unique name

The site library is a common profile shared by all site users. The terminal session CLIST creates a user profile automatically if one does not exist; it is called userid.BBPROF, where userid is your logon ID. User profile libraries allow each user to specify unique PF keys, CYCLE commands, target system defaults, a Primary Option Menu, and a unique set of application profiles.

query

One of two constituent parts of a view; the other is form. A query defines the data for a view; a form defines the display format. *See also* form, view.

real-time data

Performance data as it exists at the moment of inquiry. Real-time data is recorded during the smallest unit of time for data collection. *Contrast with* historical data. *See also* current data and interval data.

Resource Analyzer

Online real-time displays used to analyze IMS resources and determine which are affected by specific workload problems.

Resource Monitor	Online data collection services used to monitor IMS resources and issue warnings when defined utilization thresholds are exceeded.
row	(1) Horizontal component of a view or display comprising all the fields pertaining to a single device, address space, user, and so on. (2) Horizontal component of a DB2 table consisting of a sequence of values, one for each column of the table.
RxD2	Product that provides access to DB2 from REXX. It provides tools to query the DB2 catalog, issue dynamic SQL, test DB2 applications, analyze EXPLAIN data, generate DDL or DB2 utility JCL, edit DB2 table spaces, perform security administration, and much more.
sample cycle	<p>Time between data samples.</p> <p>For the CMF MONITOR Extractor, this is the time specified in the extractor control statements (usually 1 to 5 seconds).</p> <p>For real-time data, the cycle is not fixed. Data is sampled each time you press Enter.</p>
sample library	<p>Data set consisting of members each of which contains one of the following items:</p> <ul style="list-style-type: none"> • sample JCL that can be edited to perform specific functions • macro that is referenced in the assembly of user-written services • sample user exit routine <p>There can be several versions:</p> <ul style="list-style-type: none"> • the distributed sample library, called BBSAMP • a site-specific sample library or libraries <p>These can be</p> <ul style="list-style-type: none"> • a library created by AutoCustomization, called UBBSAMP • a library created manually, with a unique name
sampler	Program that monitors a specific aspect of system performance. Includes utilization thresholds used by the Exception Monitor. The CMF MONITOR Extractor contains samplers.
SBBPROF	<i>See</i> profile library.
scope	Subset of an SSI context. The scope could be all the data for the context or a subset of data within the context. It is user- or site-defined. <i>See</i> SSI context, target.

screen definition	Configuration of one or more views that have been stored with the SAVEScr command and assigned a unique name. A screen includes the layout of the windows and the view, context, system, and product active in each window.
selection view	In MAINVIEW products, view displaying a list of available views.
service class workload	<p>Collection of address spaces defined to OS/390 or z/OS. If you are running Workload Manager (WLM) in goal mode, MAINVIEW for OS/390 creates a service class workload for each service class that you define through WLM definition dialogs.</p> <p>If you are running MVS 4.3 or earlier, or MVS/SP 5.1 or later with WLM in compatibility mode, OS/390 creates a performance group workload instead of a service class. <i>See</i> performance group workload.</p>
service objective	Workload performance goal, specified in terms of response time for TSO workloads or turnaround time for batch workloads. Performance group workloads can be measured by either objective. Composite workload service objectives consist of user-defined weighting factors assigned to each constituent workload. For compatibility mode, neither OS/390 nor z/OS provides any way to measure service.
service point	<p>Specification, to MAINVIEW, of the services required to enable a specific product. Services can be actions, selectors, or views. Each target (for example, CICS, DB2, or IMS) has its own service point.</p> <p>The PLEX view lists all the defined service points known to the CAS to which the terminal session is connected.</p>
service request block (SRB)	Control block that represents a routine to be dispatched. SRB mode routines generally perform work for the operating system at a high priority. An SRB is similar to a task control block (TCB) in that it identifies a unit of work to the system. <i>See also</i> task control block.
service select code	Code entered to invoke analyzers, monitors, and general services. This code is also the name of the individual service.
session	Total period of time an address space has been active. A session begins when monitoring can be performed. If the product address space (PAS) starts after the job, the session starts with the PAS.
SG-Auto	<i>See</i> MAINVIEW SRM SG-Auto.
SG-Control	<i>See</i> MAINVIEW SRM SG-Control.

single system image (SSI)

Feature of the MAINVIEW window environment architecture where you can view and perform actions on multiple OS/390 or z/OS systems as though they were a single system. The rows of a single tabular view can contain rows from different OS/390 or z/OS images.

Skeleton Tailoring Facility

A facility in MAINVIEW AutoOPERATOR that allows skeleton JCL to be used during job submission. Skeleton JCL can contain variables within the JCL statements to be substituted with data values at job submission time. Directive statements can be used in the skeleton JCL to cause the repetition of a set of skeleton statements. This facility functions similar to the TSO skeleton tailoring facility.

SRB

See service request block.

SSI

See single system image.

SSI context

Name created to represent one or more targets for a given product. *See* context, target.

started task workload

Address spaces running jobs that were initiated programmatically.

statistics interval

For MAINVIEW for DB2, cumulative count within a predefined interval (30-minute default set by the DB2STATS parameter in the distributed BBPARM member BBIISP00) for an analyzer service DELTA or RATE display. Specifying the DELTA parameter displays the current value as the difference between the value sampled by the current analyzer request and the value sampled at the start of the current interval. Specifying the RATE parameter displays the current value by minute (DELTA divided by the number of elapsed minutes).

stem variables

A REXX facility, supported in MAINVIEW AutoOPERATOR REXX EXECs and the Skeleton Tailoring Facility, where variable names end with a period followed by a number, such as &POOL.1. This configuration allows each variable to actually represent a table or array of data, with the zero variable containing the number of entries in the array. For example, &POOL.0 = 5 would indicate variables &POOL.1 through &POOL.5 exist.

StopX37/II

See MAINVIEW SRM StopX37/II.

StorageGUARD

See MAINVIEW SRM StorageGUARD.

summary view

View created from a tabular view using the Summarize option in view customization. A summary view compresses several rows of data into a single row based on the summarize criteria.

SYSPROG services	Component of MAINVIEW for OS/390. Over 100 services that detect, diagnose, and correct OS/390 or z/OS system problems as they occur. Accessible from the OS/390 Performance and Control Main Menu. Note that this component is also available as a stand-alone product MAINVIEW SYSPROG Services.
system resource	<i>See</i> object.
target	Entity monitored by one or more MAINVIEW products, such as an OS/390 or z/OS image, an IMS or DB2 subsystem, a CICS region, or related workloads across systems. <i>See</i> context, scope, SSI context.
target context	Single target/product combination. <i>See</i> context.
TASCOSTR	MAINVIEW for IMS Offline program that summarizes detail and summary IMS Resource Utilization Files (IRUFs) to be used as input to the offline components.
task control block (TCB)	Address space-specific control block that represents a unit of work that is dispatched in the address space in which it was created. <i>See also</i> service request block.
TCB	<i>See</i> task control block.
terminal session (TS)	Single point of control for MAINVIEW products, allowing data manipulation and data display and providing other terminal user services for MAINVIEW products. The terminal session runs in a user address space (either a TSO address space or a stand-alone address space for EXCP/VTAM access).
TDIR	<i>See</i> trace log directory.
threshold	Specified value used to determine whether the data in a field meets specific criteria.
TLDS	<i>See</i> trace log data set.
total mode	Usage mode in CMFMON wherein certain columns of data reflect the cumulative value between collection intervals. Invoked by the DELta OFF command. <i>See also</i> collection interval, delta mode.
trace	(1) Record of a series of events chronologically listed as they occur. (2) Online data collection and display services that track transaction activity through DB2, IMS, or CICS.

trace log data set (TLDS)

Single or multiple external VSAM data sets containing summary or detail trace data for later viewing or printing. The trace log(s) can be defined as needed or dynamically allocated by the BBI-SS PAS. Each trace request is assigned its own trace log data set(s).

trace log directory (TDIR)

VSAM linear data set containing one entry for each trace log data set. Each entry indicates the date and time of data set creation, the current status of the data set, the trace target, and other related information.

transaction

Specific set of input data that initiates a predefined process or job.

Transaction Accountant

MVIMS Offline component that produces cost accounting and user charge-back records and reports.

TS

See terminal session.

TSO workload

Workload that consists of address spaces running TSO sessions.

UAS

See user address space.

UBBPARM

See parameter library.

UBBPROC

See procedure library.

UBBSAMP

See sample library.

user address space

Runs a MAINVIEW terminal session (TS) in TSO, VTAM, or EXCP mode.

User BBPROF

See profile library.

view

Formatted data within a MAINVIEW window, acquired from a product as a result of a view command or action. A view consists of two parts: query and form. *See also* form, job activity view, query.

view definition

Meaning of data that appears online, including source of data, selection criteria for data field inclusion and placement, data format, summarization, context, product, view name, hyperlink fields, and threshold conditions.

view command

Name of a view that you type on the COMMAND line to display that view.

view command stack

Internal stack of up to 10 queries. For each command, the stack contains the filter parameters, sort order, context, product, and time frame that accompany the view.

view help	Online help describing the purpose of a view. To display view help, place the cursor on the view name on the window information line and press PF1 (HELP).
window	Area of the MAINVIEW screen in which views and resources are presented. A window has visible boundaries and can be smaller than or equal in size to the MAINVIEW window area. <i>See</i> active window, alternate window, current window, MAINVIEW window area.
window information line	Top border of a window. Shows the window identifier, the name of the view displayed in the window, the system, the scope, the product reflected by the window, and the tomfooleries for which the data in the window is relevant. <i>See also</i> window status field.
window number	Sequential number assigned by MAINVIEW to each window when it is opened. The window number is the second character in the window status field. <i>See also</i> window status field.
window status	One-character letter in the window status field that indicates when a window is ready to receive commands, is busy processing commands, is not to be updated, or contains no data. It also indicates when an error has occurred in a window. The window status is the first character in the window status field. <i>See also</i> window information line, window status field.
window status field	Field on the window information line that shows the current status and assigned number of the window. <i>See also</i> window number, window status.
windows mode	Display of one or more MAINVIEW product views on a screen that can be divided into a maximum of 20 windows. A window information line defines the top border of each window. <i>Contrast with</i> full-screen mode.
WLM workload	In goal mode in MVS/SP 5.1 and later, a composite of service classes. MAINVIEW for OS/390 creates a workload for each WLM workload defined in the active service policy.
workflow	Measure of system activity that indicates how efficiently system resources are serving the jobs in a workload.
workload	(1) Systematic grouping of units of work (for example, address spaces, CICS transactions, IMS transactions) according to classification criteria established by a system administrator. (2) In OS/390 or z/OS, a group of service classes within a service definition.
workload activity view	Tracks workload activity as the workload accesses system resources. A workload activity view measures workload activity in terms of resource consumption and how well the workload activity meets its service objectives.

-
- Workload Analyzer** Online data collection and display services used to analyze IMS workloads and determine problem causes.
- workload definition** Workload created through the WKLIST view. Contains a unique name, a description, an initial status, a current status, and selection criteria by which address spaces are selected for inclusion in the workload. *See* Workload Definition Facility.
- Workload Definition Facility**
In MAINVIEW for OS/390, WKLIST view and its associated dialogs through which workloads are defined and service objectives set.
- workload delay view**
Tracks workload performance as the workload accesses system resources. A workload delay view measures any delay a workload experiences as it contends for those resources.
- Workload Monitor** Online data collection services used to monitor IMS workloads and issue warnings when defined thresholds are exceeded.
- workload objectives**
Performance goals for a workload, defined in WKLIST. Objectives can include measures of performance such as response times and batch turnaround times.

STOP!

IMPORTANT INFORMATION - DO NOT INSTALL THIS PRODUCT UNLESS YOU HAVE READ ALL OF THE FOLLOWING MATERIAL

By clicking the YES or ACCEPT button below (when applicable), or by installing and using this Product or by having it installed and used on your behalf, You are taking affirmative action to signify that You are entering into a legal agreement and are agreeing to be bound by its terms, EVEN WITHOUT YOUR SIGNATURE. BMC is willing to license this Product to You ONLY if You are willing to accept all of these terms. CAREFULLY READ THIS AGREEMENT. If You DO NOT AGREE with its terms, DO NOT install or use this Product; press the NO or REJECT button below (when applicable) or promptly contact BMC or your BMC reseller and your money will be refunded if by such time You have already purchased a full-use License.

SOFTWARE LICENSE AGREEMENT FOR BMC PRODUCTS

SCOPE. This is a legally binding Software License Agreement ("**License**") between You (either an individual or an entity) and BMC pertaining to the original computer files (including all computer programs and data stored in such files) contained in the enclosed Media (as defined below) or made accessible to You for electronic delivery, if as a prerequisite to such accessibility You are required to indicate your acceptance of the terms of this License, and all whole or partial copies thereof, including modified copies and portions merged into other programs (collectively, the "**Software**"). "**Documentation**" means the related hard-copy or electronically reproducible technical documents furnished in association with the Software, "**Media**" means the original BMC-supplied physical materials (if any) containing the Software and/or Documentation, "**Product**" means collectively the Media, Software, and Documentation, and all Product updates subsequently provided to You, and "**You**" means the owner or lessee of the hardware on which the Software is installed and/or used. "**BMC**" means BMC Software Distribution, Inc. unless You are located in one of the following regions, in which case "BMC" refers to the following indicated BMC Software, Inc. subsidiary: (i) Europe, Middle East or Africa --BMC Software Distribution, B.V., (ii) Asia/Pacific -- BMC Software Asia Pacific Pte Ltd., (iii) Brazil -- BMC Software do Brazil, or (iv) Japan -- BMC Software K.K. If You enter into a separate, written software license agreement signed by both You and BMC or your authorized BMC reseller granting to you the rights to install and use this Product, then the terms of that separate, signed agreement will apply and this License is void.

FULL-USE LICENSE. Subject to these terms and payment of the applicable license fees, BMC grants You this non-exclusive License to install and use one copy of the Software for your internal use on the number(s) and type(s) of servers or workstations for which You have paid or agreed to pay to BMC or your BMC reseller the appropriate license fee. If your license fee entitles You only to a License having a limited term, then the duration of this License is limited to that term; otherwise this License is perpetual, subject to the termination provisions below.

TRIAL LICENSE. If You have not paid or agreed to pay to BMC or your BMC Reseller the appropriate license fees for a full use license, then, **NOTWITHSTANDING ANYTHING TO THE CONTRARY CONTAINED IN THIS LICENSE:** (i) this License consists of a non-exclusive evaluation license ("Trial License") to use the Product for a limited time ("Trial Period") only for evaluation; (ii) during the Trial Period, You may not use the Software for development, commercial, production, database management or other purposes than those expressly permitted in clause (i) immediately above; and (iii) your use of the Product is on an **AS IS** basis, and **BMC, ITS RESELLERS AND LICENSORS GRANT NO WARRANTIES OR CONDITIONS (INCLUDING IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE) TO YOU AND ACCEPT NO LIABILITY WHATSOEVER RESULTING FROM THE USE OF THIS PRODUCT UNDER THIS TRIAL LICENSE.** If You use this Product for other than evaluation purposes or wish to continue using it after the Trial Period, you must purchase a full-use license. When the Trial Period ends, your right to use this Product automatically expires, though in certain cases You may be able to extend the term of the Trial Period by request. Contact BMC or your BMC reseller for details.

TERM AND TERMINATION. This License takes effect on the first to occur of the date of shipment or accessibility to You for electronic delivery, as applicable (the "**Product Effective Date**"). You may terminate this License at any time for any reason by written notice to BMC or your BMC reseller. This License and your right to use the Product will terminate automatically with or without notice by BMC if You fail to comply with any material term of this License. Upon termination, You must erase or destroy all components of the Product including all copies of the Software, and stop using or accessing the Software. Provisions concerning Title and Copyright, Restrictions (or Restricted Rights, if You are a U.S. Government entity) or limiting BMC's liability or responsibility shall survive any such termination.

TITLE AND COPYRIGHT; RESTRICTIONS. All title and copyrights in and to the Product, including but not limited to all modifications thereto, are owned by BMC and/or its affiliates and licensors, and are protected by both United States copyright law and applicable international copyright treaties. You will not claim or assert title to or ownership of the Product. To the extent expressly permitted by applicable law or treaty notwithstanding this limitation, You may copy the Software only for backup or archival purposes, or as an essential step in utilizing the Software, but for no other purpose. You will not remove or alter any copyright or proprietary notice from copies of the Product. You acknowledge that the Product contains valuable trade secrets of BMC and/or its affiliates and licensors. Except in accordance with the terms of this License, You agree (a) not to decompile, disassemble, reverse engineer or otherwise attempt to derive the Software's source code from object code except to the extent expressly permitted by applicable law or treaty despite this limitation; (b) not to sell, rent, lease, license, sublicense, display, modify, time share, outsource or otherwise transfer the Product to, or permit the use of this Product by, any third party; and (c) to use reasonable care and protection to prevent the unauthorized use, copying, publication or dissemination of the Product and BMC confidential information learned from your use of the Product. **You will not export or re-export any Product without both the written consent of BMC and the appropriate U.S. and/or foreign government license(s) or license exception(s).** Any programs, utilities, modules or other software or documentation created, developed, modified or enhanced by or for You using this Product shall likewise be subject to these restrictions. BMC has the right to obtain injunctive relief against any actual or threatened violation of these restrictions, in addition to any other available remedies. Additional restrictions may apply to certain files, programs or data supplied by third parties and embedded in the Product; consult the Product installation instructions or Release Notes for details.

LIMITED WARRANTY AND CONDITION. If You have purchased a Full-Use License, BMC warrants that (i) the Media will be, under normal use, free from physical defects, and (ii) for a period of ninety (90) days from the Product Effective Date, the Product will perform in substantial accordance with the operating specifications contained in the Documentation that is most current at the Product Effective Date. BMC's entire liability and your exclusive remedy under this provision will be for BMC to use reasonable best efforts to remedy defects covered by this warranty

and condition within a reasonable period of time or, at BMC's option, either to replace the defective Product or to refund the amount paid by You to license the use of the Product. BMC and its suppliers do not warrant that the Product will satisfy your requirements, that the operation of the Product will be uninterrupted or error free, or that all software defects can be corrected. This warranty and condition shall not apply if: (i) the Product is not used in accordance with BMC's instructions, (ii) a Product defect has been caused by any of your or a third party's malfunctioning equipment, (iii) any other cause within your control causes the Product to malfunction, or (iv) You have made modifications to the Product not expressly authorized in writing by BMC. No employee, agent or representative of BMC has authority to bind BMC to any oral representations, warranties or conditions concerning the Product. **THIS WARRANTY AND CONDITION IS IN LIEU OF ALL OTHER WARRANTIES AND CONDITIONS. THERE ARE NO OTHER EXPRESS OR IMPLIED WARRANTIES OR CONDITIONS, INCLUDING THOSE OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, REGARDING THIS LICENSE OR ANY PRODUCT LICENSED HEREUNDER. THIS PARAGRAPH SHALL NOT APPLY TO A TRIAL LICENSE.** Additional support and maintenance may be available for an additional charge; contact BMC or your BMC reseller for details.

LIMITATION OF LIABILITY. Except as stated in the next succeeding paragraph, BMC's and your BMC reseller's total liability for all damages in connection with this License is limited to the price paid for the License. **IN NO EVENT SHALL BMC BE LIABLE FOR ANY CONSEQUENTIAL, SPECIAL, INCIDENTAL, PUNITIVE OR INDIRECT DAMAGES OF ANY KIND ARISING OUT OF THE USE OF THIS PRODUCT (SUCH AS LOSS OF PROFITS, GOODWILL, BUSINESS, DATA OR COMPUTER TIME, OR THE COSTS OF RECREATING LOST DATA), EVEN IF BMC HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.** Some jurisdictions do not permit the limitation of consequential damages so the above limitation may not apply.

INDEMNIFICATION FOR INFRINGEMENT. BMC will defend or settle, at its own expense, any claim against You by a third party asserting that your use of the Product within the scope of this License violates such third party's patent, copyright, trademark, trade secret or other proprietary rights, and will indemnify You against any damages finally awarded against You arising out of such claim. However, You must promptly notify BMC in writing after first receiving notice of any such claim, and BMC will have sole control of the defense of any action and all negotiations for its settlement or compromise, with your reasonable assistance. BMC will not be liable for any costs or expenditures incurred by You without BMC's prior written consent. If an order is obtained against your use of the Product by reason of any claimed infringement, or if in BMC's opinion the Product is likely to become the subject of such a claim, BMC will at its option and expense either (i) procure for You the right to continue using the product, or (ii) modify or replace the Product with a compatible, functionally equivalent, non-infringing Product, or (iii) if neither (i) nor (ii) is practicable, issue to You a pro-rata refund of your paid license fee(s) proportionate to the number of months remaining in the 36 month period following the Product Effective Date. This paragraph sets forth your only remedies and the total liability to You of BMC, its resellers and licensors arising out of such claims.

GENERAL. This License is the entire understanding between You and BMC concerning this License and may be modified only in a mutually signed writing between You and BMC. If any part of it is invalid or unenforceable, that part will be construed, limited, modified, or, severed so as to eliminate its invalidity or unenforceability. This License will be governed by and interpreted under the laws of the jurisdiction named below, without regard to conflicts of law principles, depending on which BMC Software, Inc. subsidiary is the party to this License: (i) BMC Software Distribution, Inc. - the State of Texas, U.S.A., (ii) BMC Software Distribution, B.V. - The Netherlands, (iii) BMC Software Asia Pacific Pte Ltd. -- Singapore (iv) BMC Software do Brazil -- Brazil, or (v) BMC Software K.K. -- Japan. Any person who accepts or signs changes to the terms of this License promises that they have read and understood these terms, that they have the authority to accept on your behalf and legally obligate You to this License. Under local law and treaties, the restrictions and limitations of this License may not apply to You; You may have other rights and remedies, and be subject to other restrictions and limitations.

U.S. GOVERNMENT RESTRICTED RIGHTS. UNPUBLISHED -- RIGHTS RESERVED UNDER THE COPYRIGHT LAWS OF THE UNITED STATES. Use, duplication, or disclosure by the U.S. Government is subject to restrictions set forth in FAR Section 52.227-14 Alt. III (g)(3), FAR Section 52.227-19, DFARS 252.227-7014 (b) or DFARS 227.7202, as amended from time to time. Contractor/Manufacturer is BMC Software, Inc., 2101 CityWest Blvd., Houston, TX 77042-2827, USA. Any contract notices should be sent to this address.
